Brazilian Presence

In the Technical Committees – IMEKO's Technical Work

34 Members in 21 Technical Committees

Technical Committee activities:

- workshops,
- seminars,
- symposia, and
- conferences
- publishing proceedings of events,
- textbooks, glossaries, and studies

IMEKO XVIII World Congress
Rio de Janeiro, RJ, Brazil - 2006

The International Measurement Confederation (IMEKO) is a non-governmental federation of 36 Member Organizations individually concerned with the advancement of measurement technology.

Its fundamental objectives are the promotion of international interchange of scientific and technical information in the field of measurement and instrumentation and the enhancement of international co-operation among scientists and engineers from research and industry.

Founded in 1958, the Confederation has consultative status with UNESCO and UNIDO and is one of the five Sister Federations within Five International Associations Coordinating Committee (FIACC), further consisting of International Federation of Automatic Control (IFAC); International Federation for Information Processing (IFIP); International Federation of Operational Research Societies (IFORS) and International Association for Mathematics and Computers in Simulation (IMACS).

Brazilian Presence in IMEKO

XVIII IMEKO World Congress, 17 - 22 September 2006 Rio de Janeiro Brazil

A highly successful Congress with:

- 823 participants from
- 59 countries of the globe enjoyed the presentation of
- 548 contributions (oral and posters).

IMEKO XVIII WORLD CONGRESS
Metrology for a sustainable development
Organized by the Brazilian Society of Metrology
in connection with the IV Brazilian Congress of Metrology

Rio de Janeiro, RJ, BRAZIL
September 17-22, 2006

IMEKO Presence at METROLOGIA 2025

SEMETRO – XVI International Congress of Electrical Metrology

IMEKO TC4 Measurement of Electrical Quantities Workshop 2 - 3 December, Maceió – Alagoas.

Time	December 2, 2025, Tuesday	December 3, 2025, Wednesday
11:00 AM – 12:30 PM	Parallel Sessions 1 Each block with 6 oral presentations of 15 min CBM/CBM/RBMLQ-I/SEMETRO (IMEKO TC4) – Schedule (UTC -3)/CIMMEC/CBMRI	Parallel Sessions 3 Each block with 6 oral presentations of 15 min CBM/CBM/RBMLQ- I/SEMETRO (IMEKO TC4) – Schedule (UTC -3)/CIMMEC/CBMRI

METROLOGIA
150 anos de confiabilidade
para um futuro sustentável **2025**

**1-4 December Brazil
WITH IMEKO PRESENCE**

13 Conferences in 2025 – 2026

- TC3 Measurement of Force, Mass, Torque, and Gravity, TC5 Hardness Measurement, TC16 Pressure and Vacuum Measurement, TC22 Vibration Measurement, the Third International Conference on Dynamic Measurement, 23-27 March 2026, Hangzhou, China.

- TC9, Flow Measurement, FLOMEKO2026, 17-20, May 2026, Nara/Japan.

Events 2027

- The XXV. IMEKO World Congress, Metrology for Humanity 30 August – 3 September 2027, Rimini, Italy.

- TC2 Photonics, International Symposium on Modern Photonic Metrology, PHOTOMET 2025, 1-3 September 2025, Modena, Italy.

- TC6 Digitalisation, Second International Conference on Metrology and Digital Transformation, M4Dconf 2025, 3-5 September, Benevento, Italy.

- TC7, Measurement Science and TC13, Measurements in Biology and Medicine, "Test and Measurement" conference, 15-17 September 2025, Pretoria, South Africa.

- TC8, TC11, and TC24 joint conference (TC8 Traceability, TC11 Measurement in Testing, Inspection and Certification, and TC24 Chemical Measurements) will be held from 14-17 September 2025, in Torino, Italy.

- TC12 Temperature and Thermal Measurements, TEMPMEKO-ISHM 2025, 20-25 October, Reims, France

Measurement, Sensor Systems and Applications Conference

MeSSAC 2025

17-20 August 2025
Hangzhou, China

Measurement, Sensor Systems and Applications Conference 2025

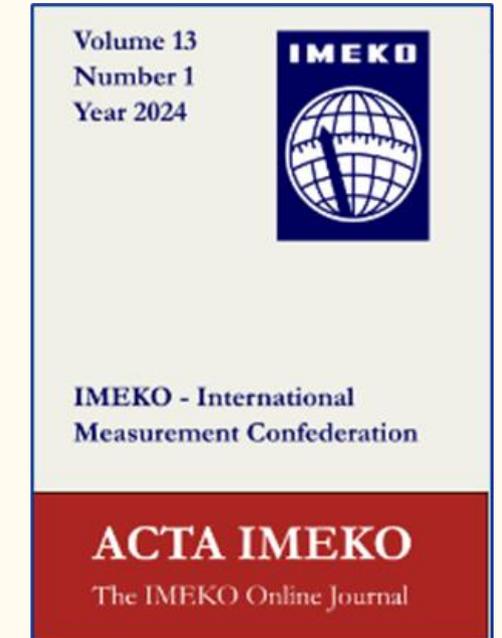

MeSSAC 2025 with 200 registrations!

- included all scientific domains where measurements are applied, from chemistry to food, from physics to engineering, from metrology to sensors and instruments.
- was a unique event and one of the most important conferences in the field of sensors and measurement.

Our Journals

New!

IMEKO Journals published by Elsevier show a very positive upward trend, better than the major competitors. Measurement's impact factor 5,6.

IMEKO's own open access Journal with 4 issues a year. Impact factor 1.

Settings

<https://ourworldindata.org/co2-emissions>

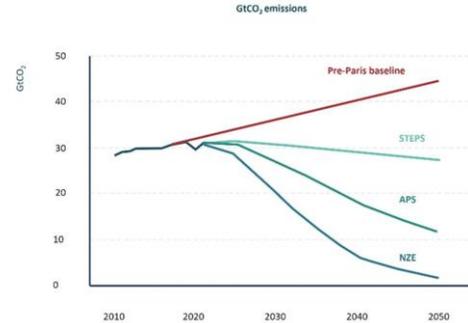

IC MAKING: MATERIAL CONSUMPTION

- ❖ One IC fab can use tens of millions litre per day
- ❖ Large amounts of raw materials (silicon, GaAs, Copper, Tungsten, Tantalium, ...)
 - ❖ Mining and refining of these materials have high carbon footprint, produce toxic tailings, sometimes occur in regions with weak environmental regulations
- ❖ Supply chain circularity for ultra-high-purity materials is almost non existent today
- ❖ Solid and liquid waste (solvents, acids, ...): effluents need multi-stage treatment to remove fluorides, heavy metals, and organics before discharge

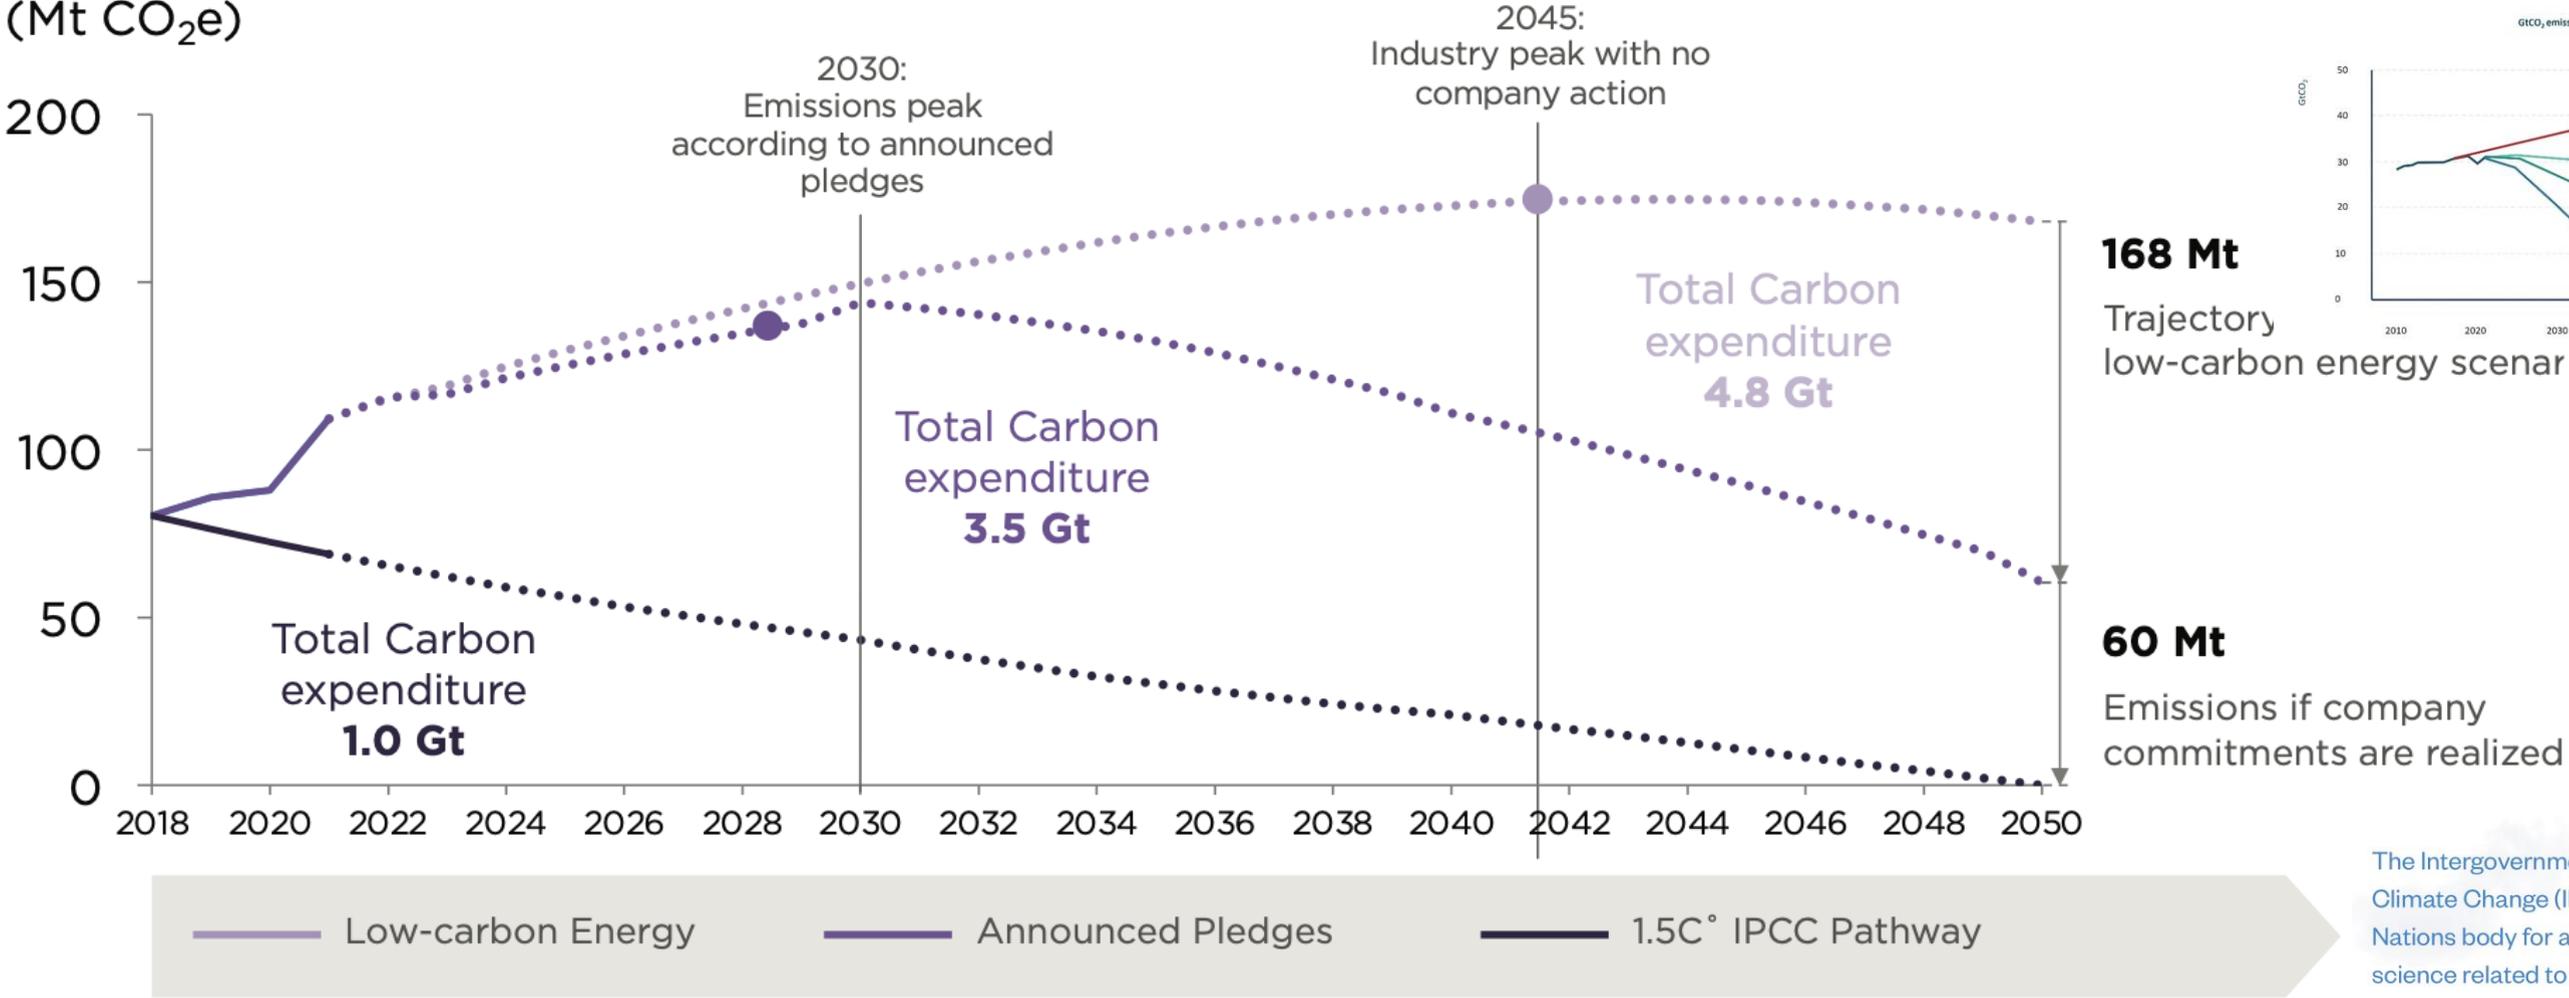

Transparency, Ambition, and Collaboration:

Advancing the Climate Agenda of the Semiconductor Value Chain

The IEA scenarios — emissions trajectories

Manufacturing Emissions (Mt CO₂e)

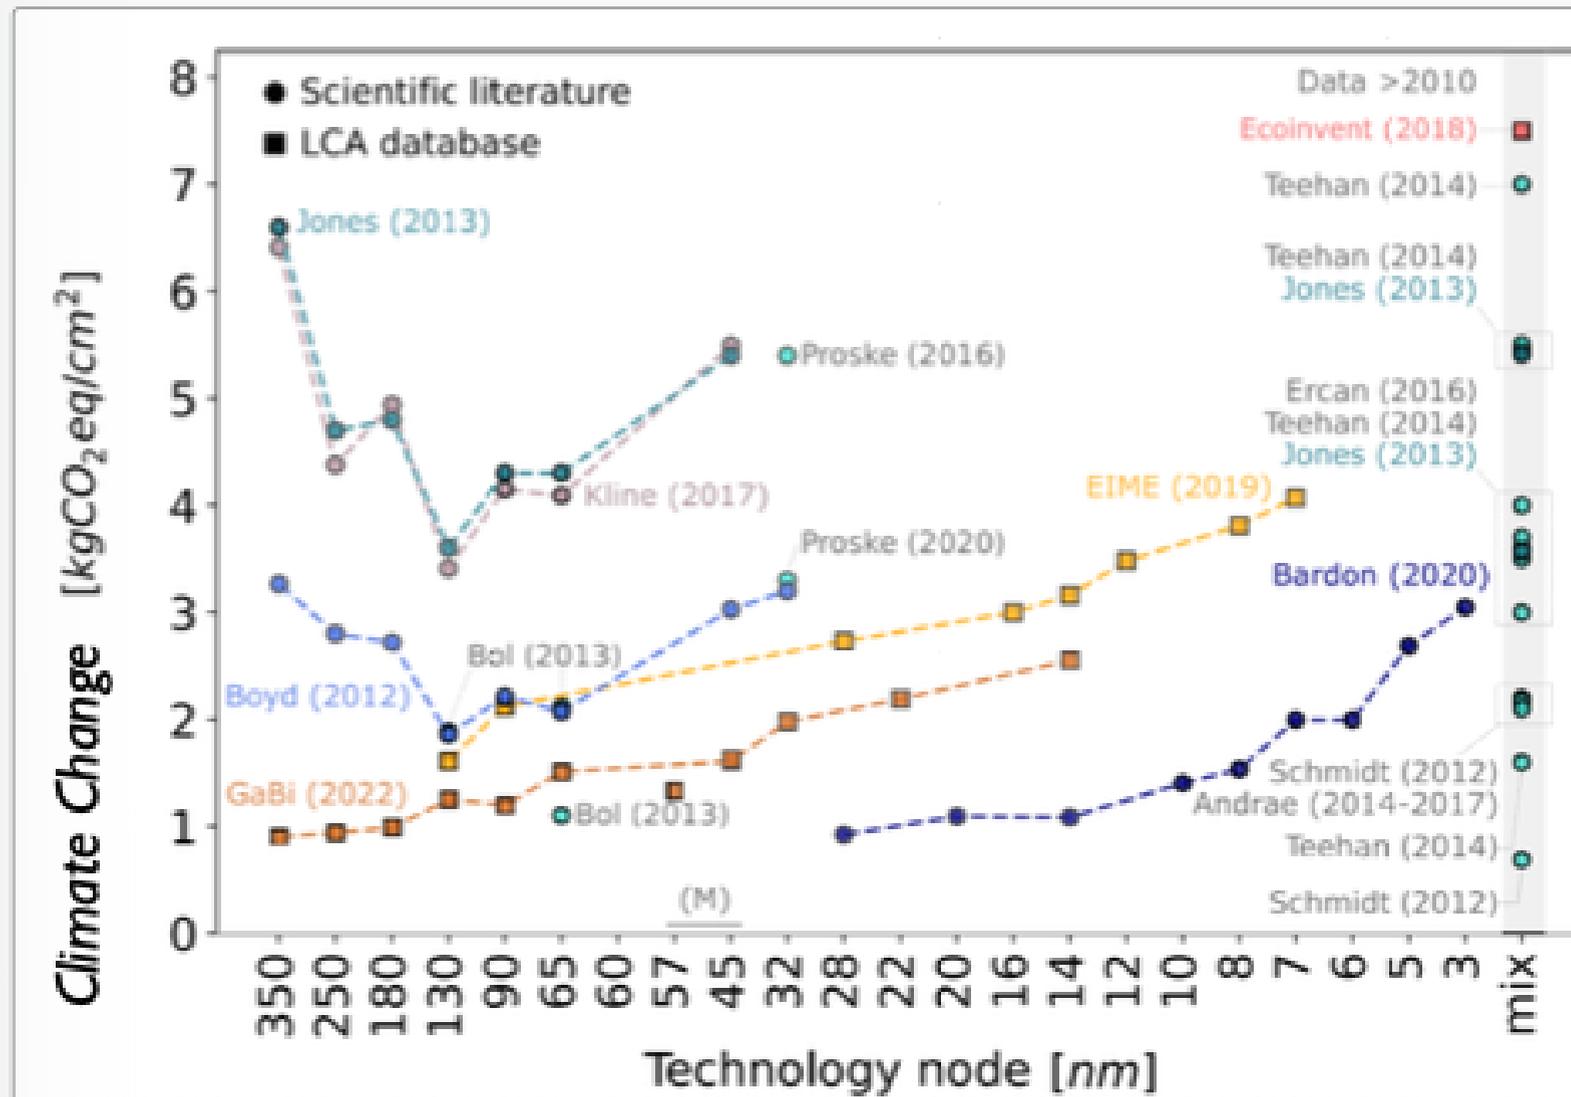

1 Emissions growth based on projected capacity growth (3.25%) and average intensity growth (1.01%), all else constant
 Note: Low-carbon energy scenarios use IEA STEPS for North America, Europe, and Asia-Pacific. Source: BCG analyses on data from: CDP, imec, SEMI, IEA

The Intergovernmental Panel on Climate Change (IPCC) is the United Nations body for assessing the science related to climate change.

Lifecycle assessment literature to increase awareness

Literature / LCA database uses variable:

- Scope
- Data sources (primary vs. secondary)
- Approaches (bottom-up vs top-down)
- “creative” plugging of data gaps

Source: Pirson et al., 2023
Review, Analysis, and Less...

- 10 / ESG Management Strategy
- 13 / Double Materiality Assessment Go to page 13
- 15 / Communication with Stakeholders

Reporting as tool to create awareness and involve stakeholders, e.g., HT Micron

E-WASTE: WHAT IS EFFECTIVE IN CHANGING BEHAVIORS?

Community “Repair Cafés”

- **Repair-friendly design and labeling:**

Making repairability scores *visible at the point of sale* (as in France)

- **Peer comparison for energy use:**

(e.g., “your office uses 20% more standby energy”)

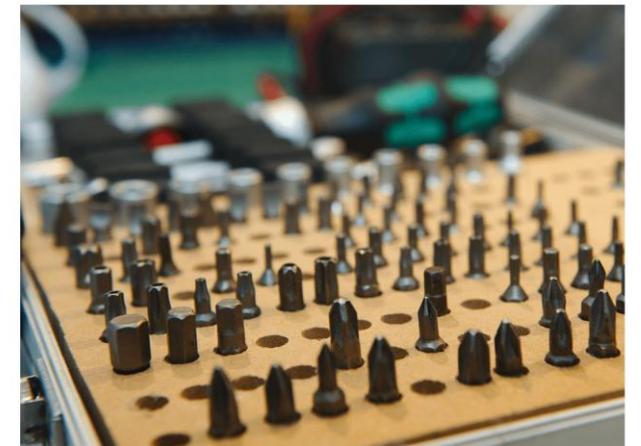

Offering cash rewards or discounts for returning old phones, batteries, or devices increases return rates dramatically

- **Mechanism: Leverages *loss aversion***—people dislike leaving value unclaimed

- Apple’s Trade-In program and EU deposit-refund pilots achieve recovery rates above 80%.

Funding for German Repair Cafés

Measuring aggregate electricity savings from the diffusion of more efficient lighting technologies

Julián Moral-Carcedo · Julián Pérez-García

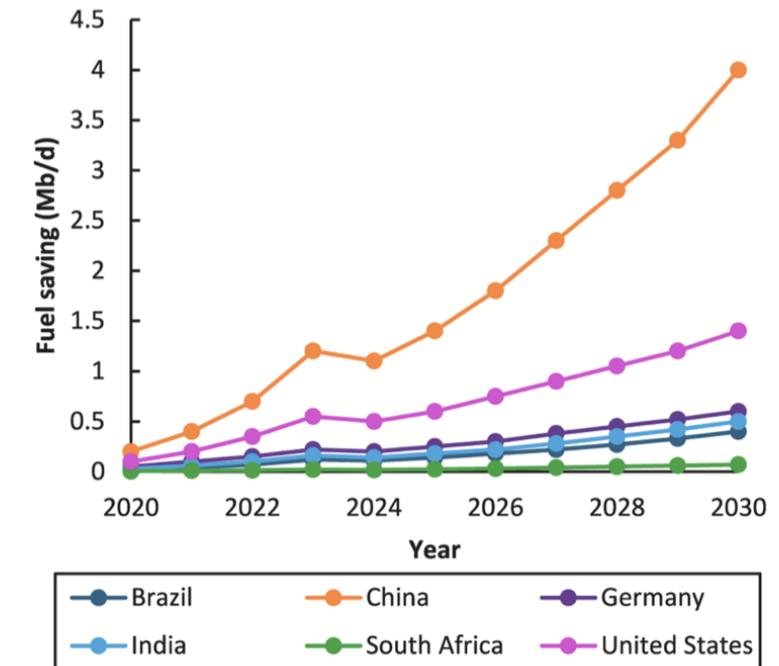

Fig. 8. Projected fuel savings from EV Adoptions (2020–2030) across major economies.

Review article
 Societal, environmental, and economic impacts of electric vehicles towards achieving sustainable development goals
 Ahmed A. Arefin ^a, Sheikh T. Meraj ^b, M.S. Hossain Lipu ^c, Md. Siddikur Rahman ^d, Tuhibur Rahman ^e, Kamrul Hasan ^f, Mahidur R. Sarker ^{g,h}, Kashem M. Muttaqi ^e

INCREMENTAL IMPROVEMENTS

Power electronics involves efficient conversion and control of electrical power using switching devices

Conversion efficiencies of up to 98–99%

Power electronics enable up to 30% energy savings in electric motor drives in industry

Need in-field on-chip measurements, BIST, to measure properties online to cope with variations in the IC behavior due to production process imperfect control, also with aging

Other field emerge such as packaged photonics that raise new test challenges

These technologies are foundational to modern electrical systems and are instrumental in optimizing power usage across various sectors.

Do we need measurements?

Yes! — measurement support cutting waste, saving energy, and making electronics safer.

ROLE OF METROLOGY:

When making ICs

Common problem in IC making is variability:

- goal reduce variability – disciplines and new procedures
- Reducing false defect: better measurement, fewer decision errors -> Metrology is at the forefront of yield
- Emerging techniques for wafer inspection and IC testing

For the environment:

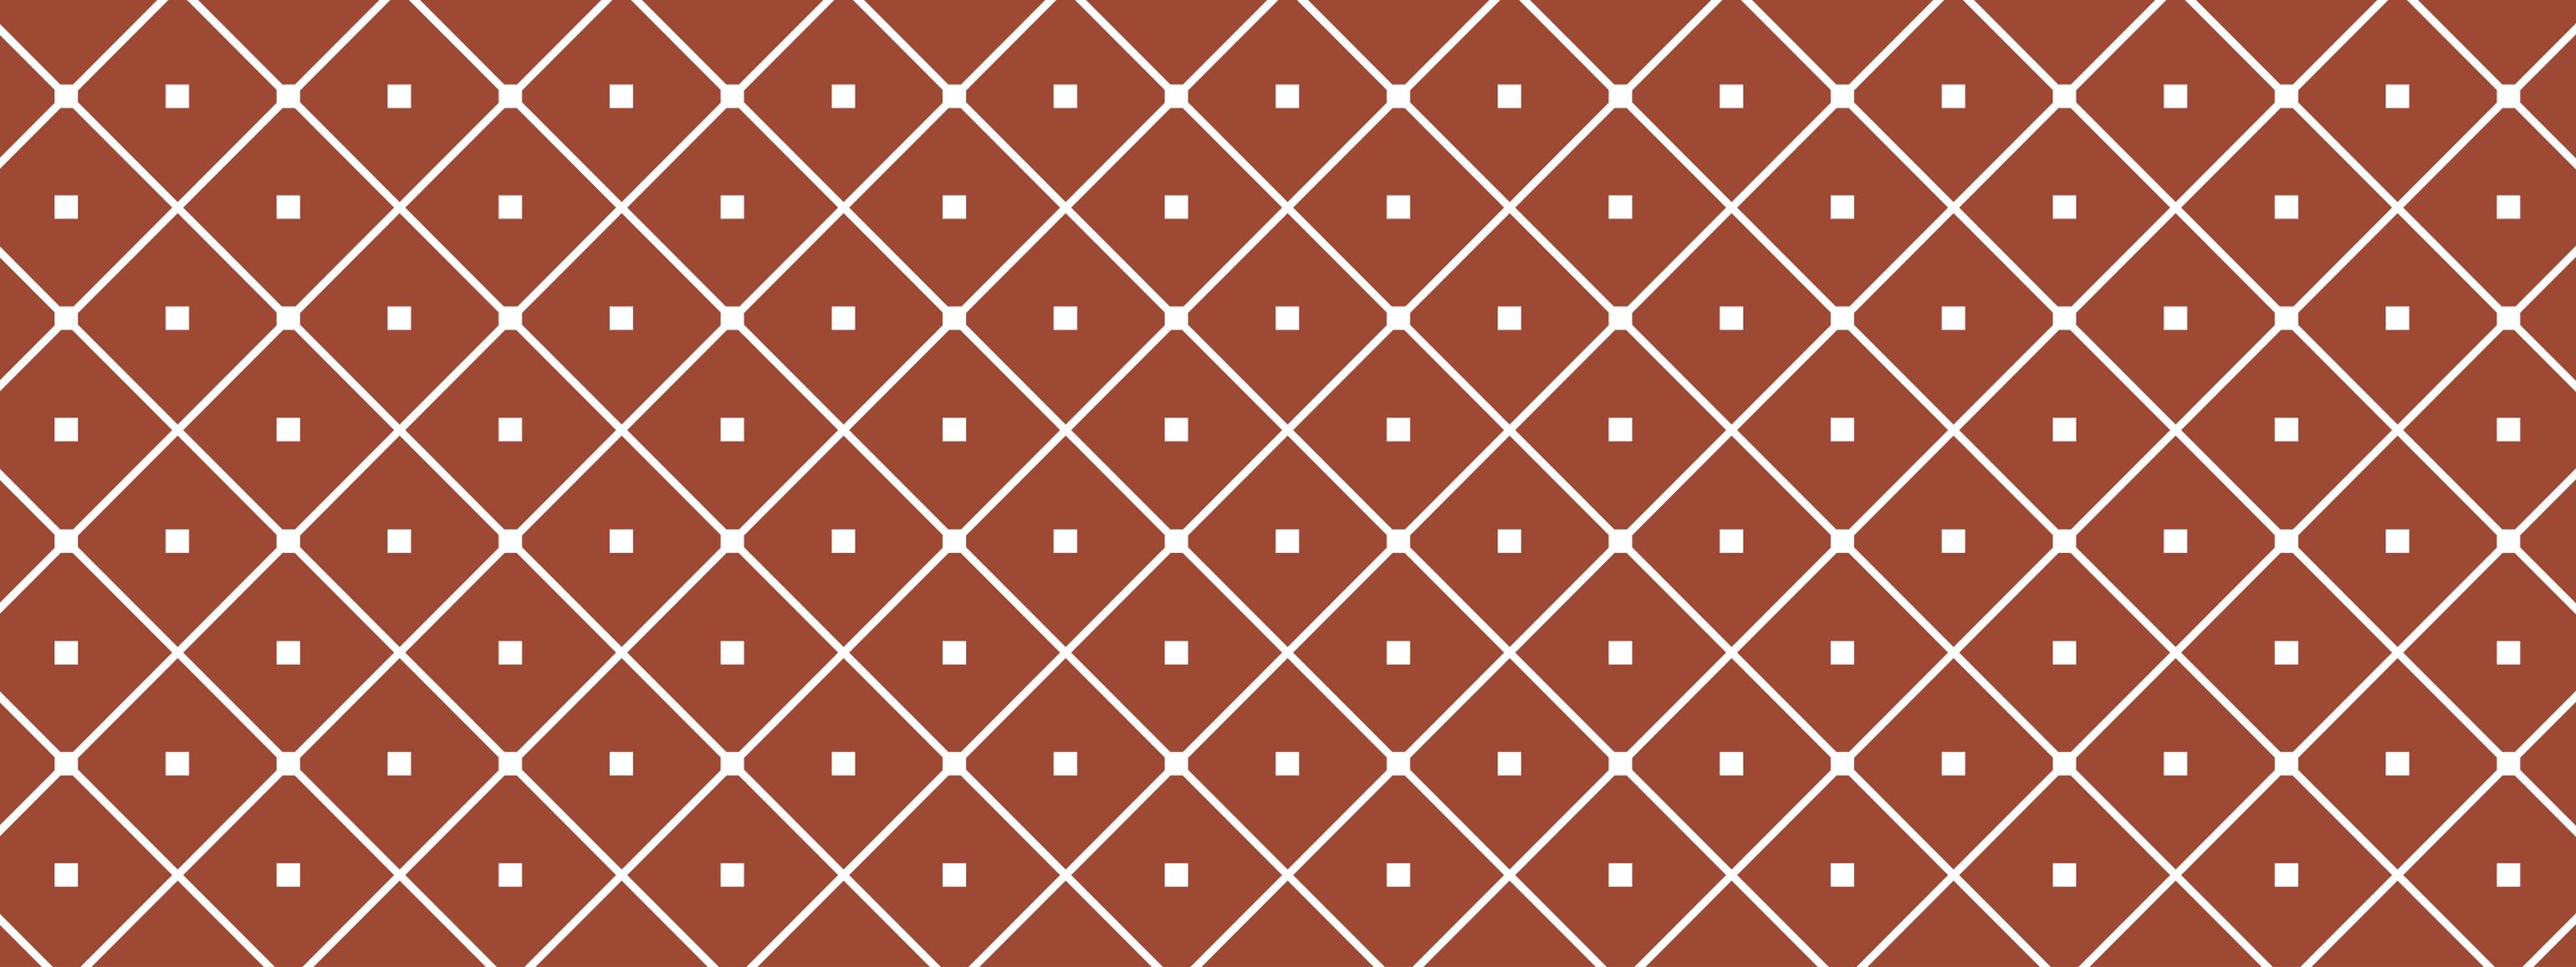

- Need standards, measurements to sustain e-waste recycling process optimization and lifecycle assessment
- Environmental Monitoring Systems
- Metrology, accreditation, conformity assessment, and market surveillance are key players
<https://semiengineering.com/defeating-overkill-metrologys-role-in-reducing-false-defects/>

What can STEM education do?

Include sustainability in the taught disciplines

Historically, engineering programs emphasize how to design systems not how they break down, nor how to care for system's lifecycle

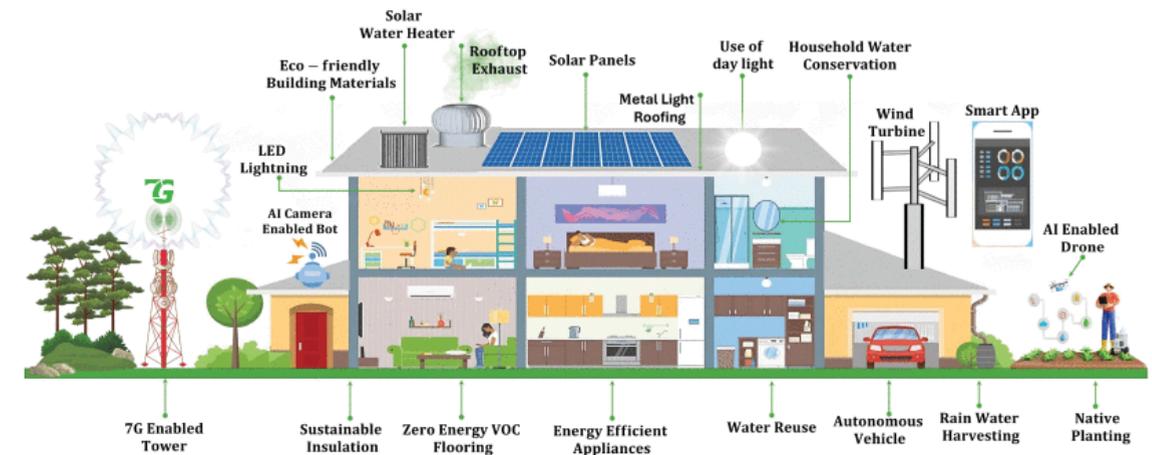

DESIGN FOR SIMPLE MEASUREMENT SYSTEM

NEW CHALLENGES: MEASUREMENT AND SENSING

Key Trends:

- Miniaturized Sensor Development:
- Emergence of Wireless Sensor Networks:
- Increased Adoption of IoT and Connectivity:

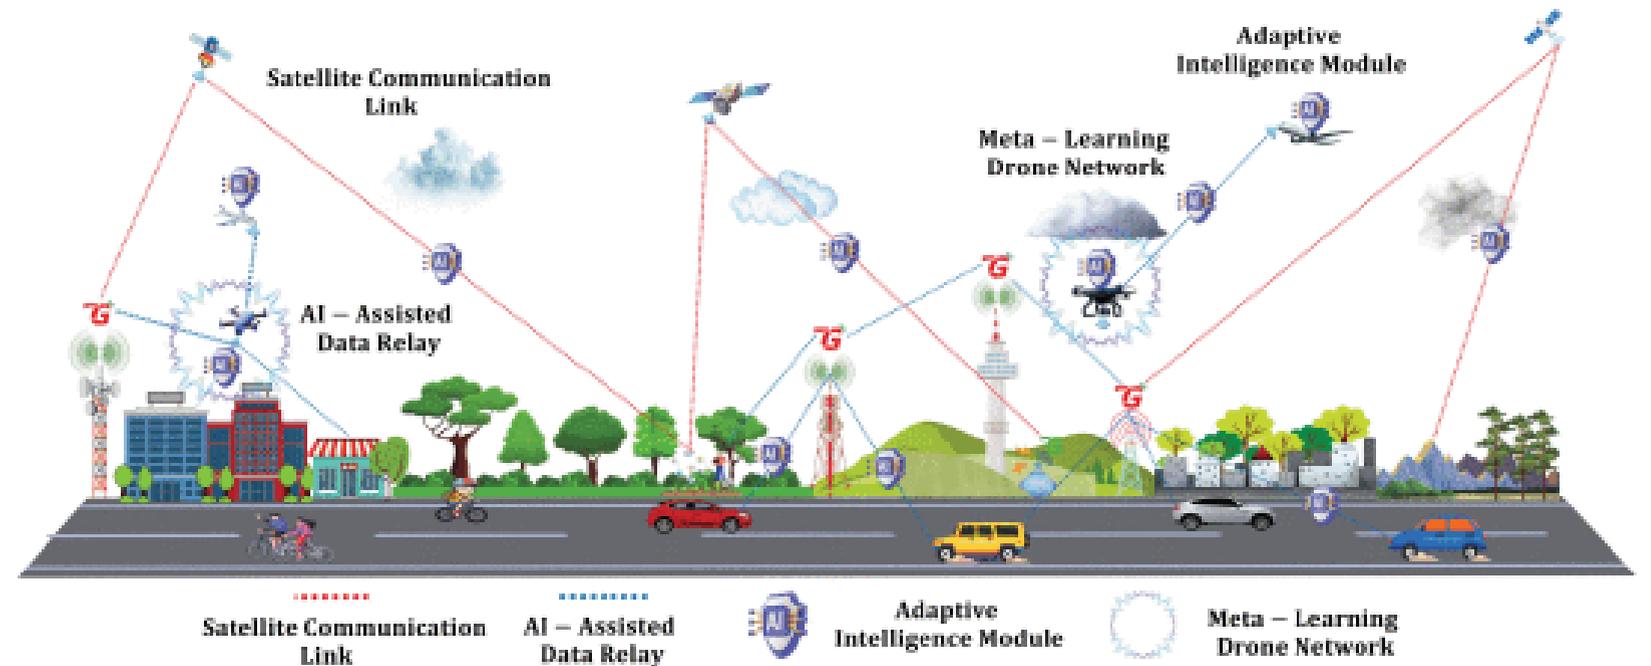

Santander: the smart Spanish city with more than 10,000 deployed sensors

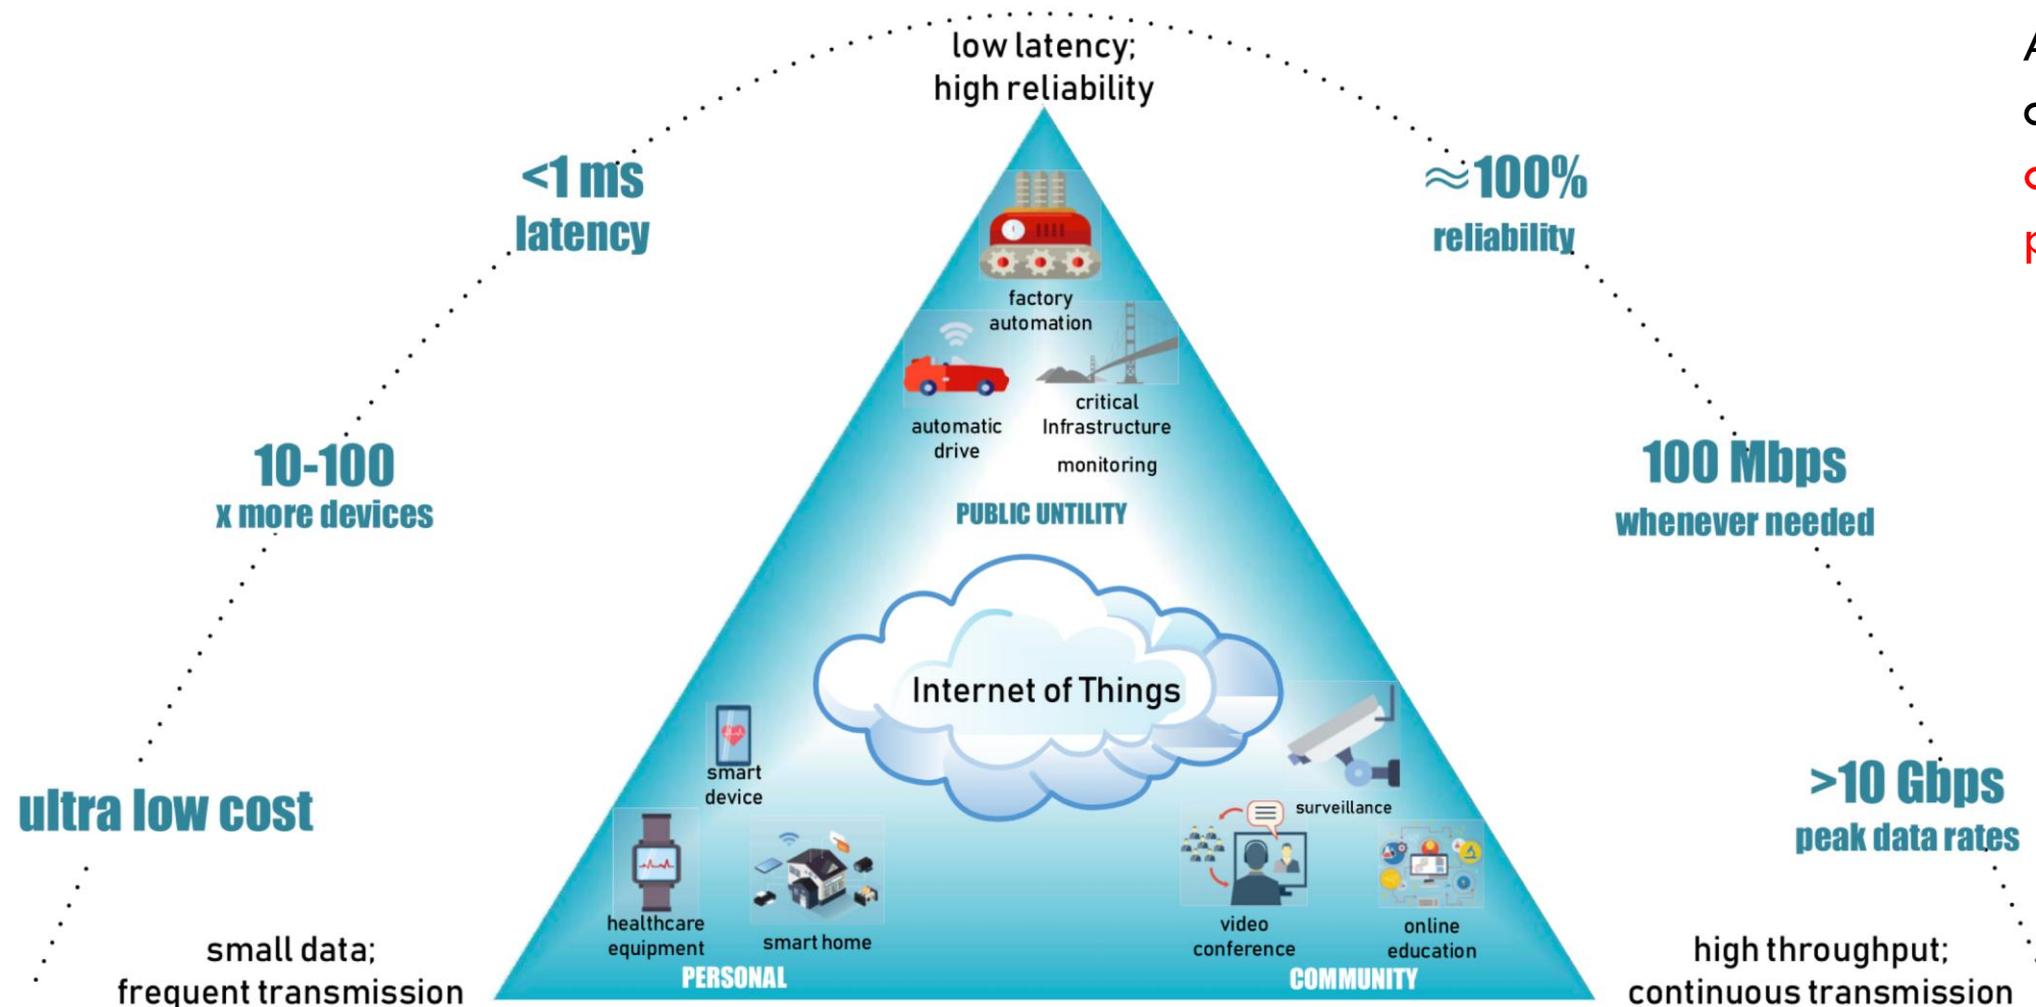

California monitoring of freeway system based on 40,000 sensors within the Performance Measurement Systems

Wide-area sensor networks would benefit from self-sensing and BIST capabilities

NEW CHALLENGES: 7G

ONE-BIT TO FIT VARIOUS DEMANDS

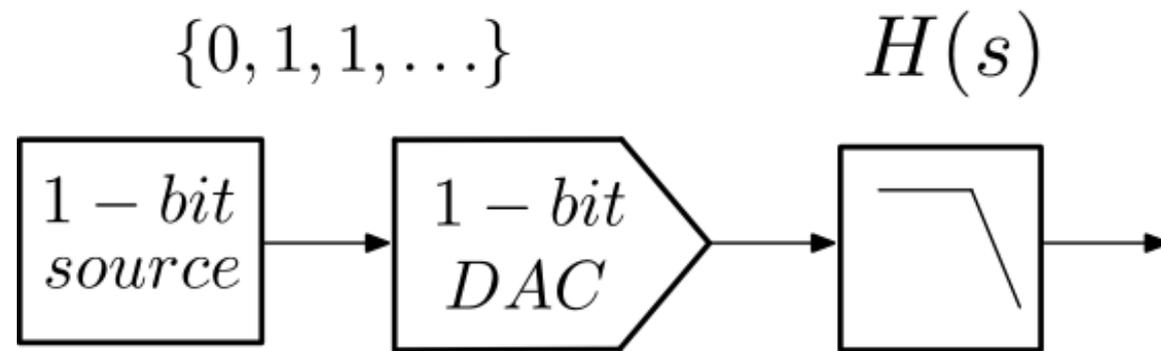

All applications in an IOT context could benefit from **one-bit data acquisition and processing**

LOW-COMPLEXITY MEASUREMENT AND TESTING

ONE-BIT SYNTHESIS OF ANALOG SIGNALS

- Filtered binary sequence to generate continuous signals from binary sequences
- Properties of binary signal defined in the frequency-domain

- **Why?**
 - To ease operations at IC level
 - To provide analog signals for BIST purposes
 - To optimize hardware resources
 - To simplify hardware, reduce peak consumption, optimize battery life

Design binary sequence to optimize frequency behavior

SYNTHESIS OF ANALOG SIGNALS: HOW

Quadratic binary unconstrained optimization (QUBO)

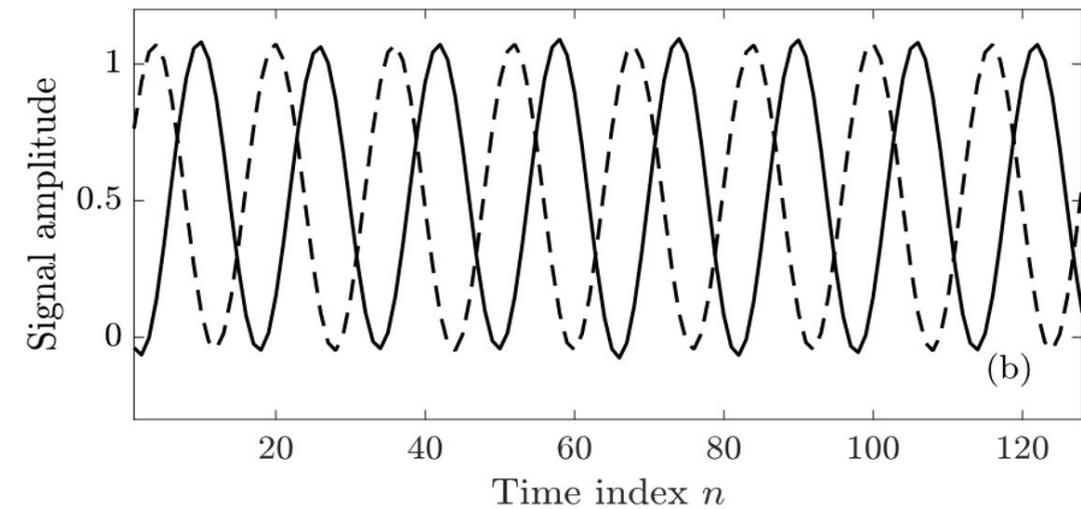

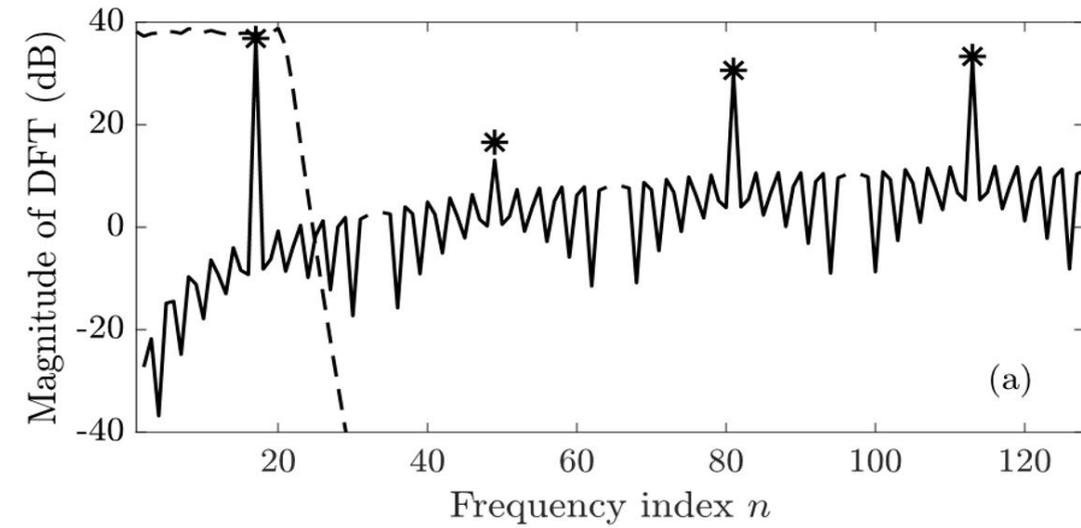

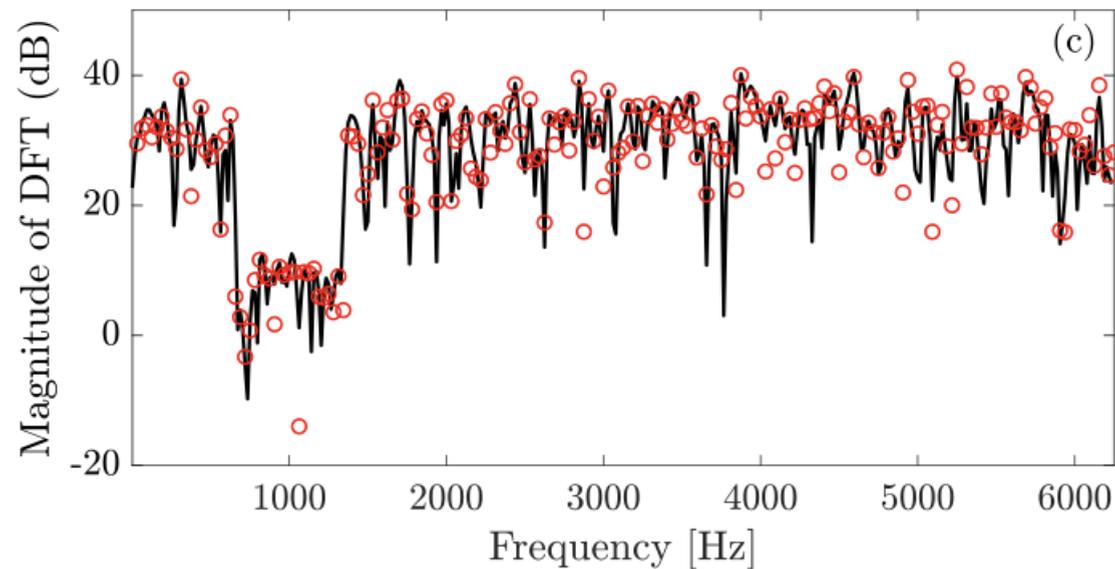

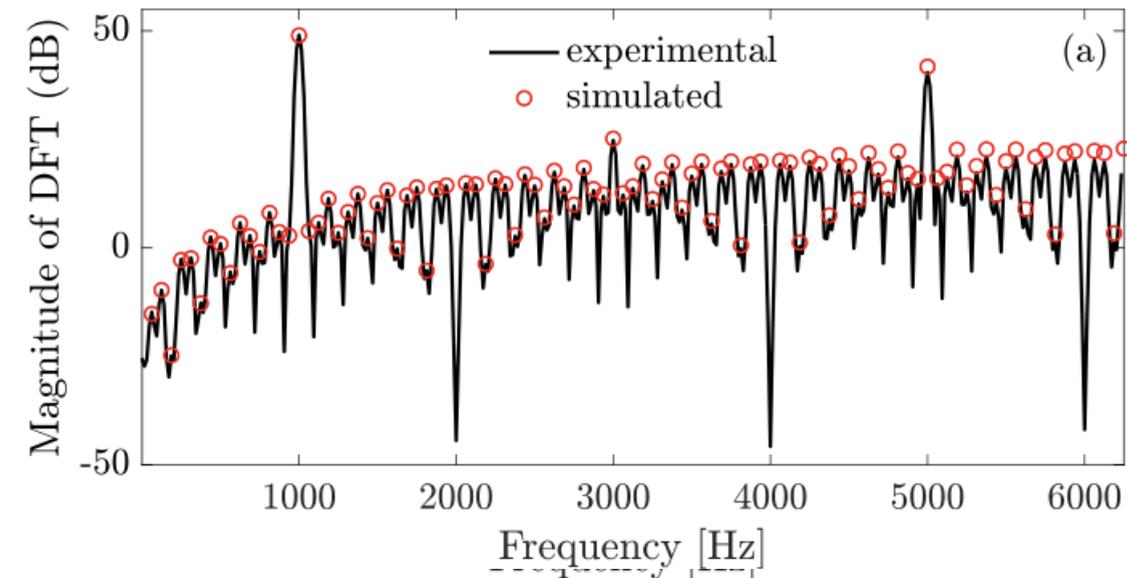

$$\min_{\mathbf{x} \in \{0,1\}^N} \mathbf{x}^T \mathbf{Q} \mathbf{x}$$

\mathbf{Q} is a $N \times N$ matrix of constant values, originating from a *Fourier* matrix

Objective: given \mathbf{Q} such that it represents frequency domain behavior, find **binary** \mathbf{x} to maximize cost function

Problem can be cast into a problem solvable by QUANTUM ANNEALERS

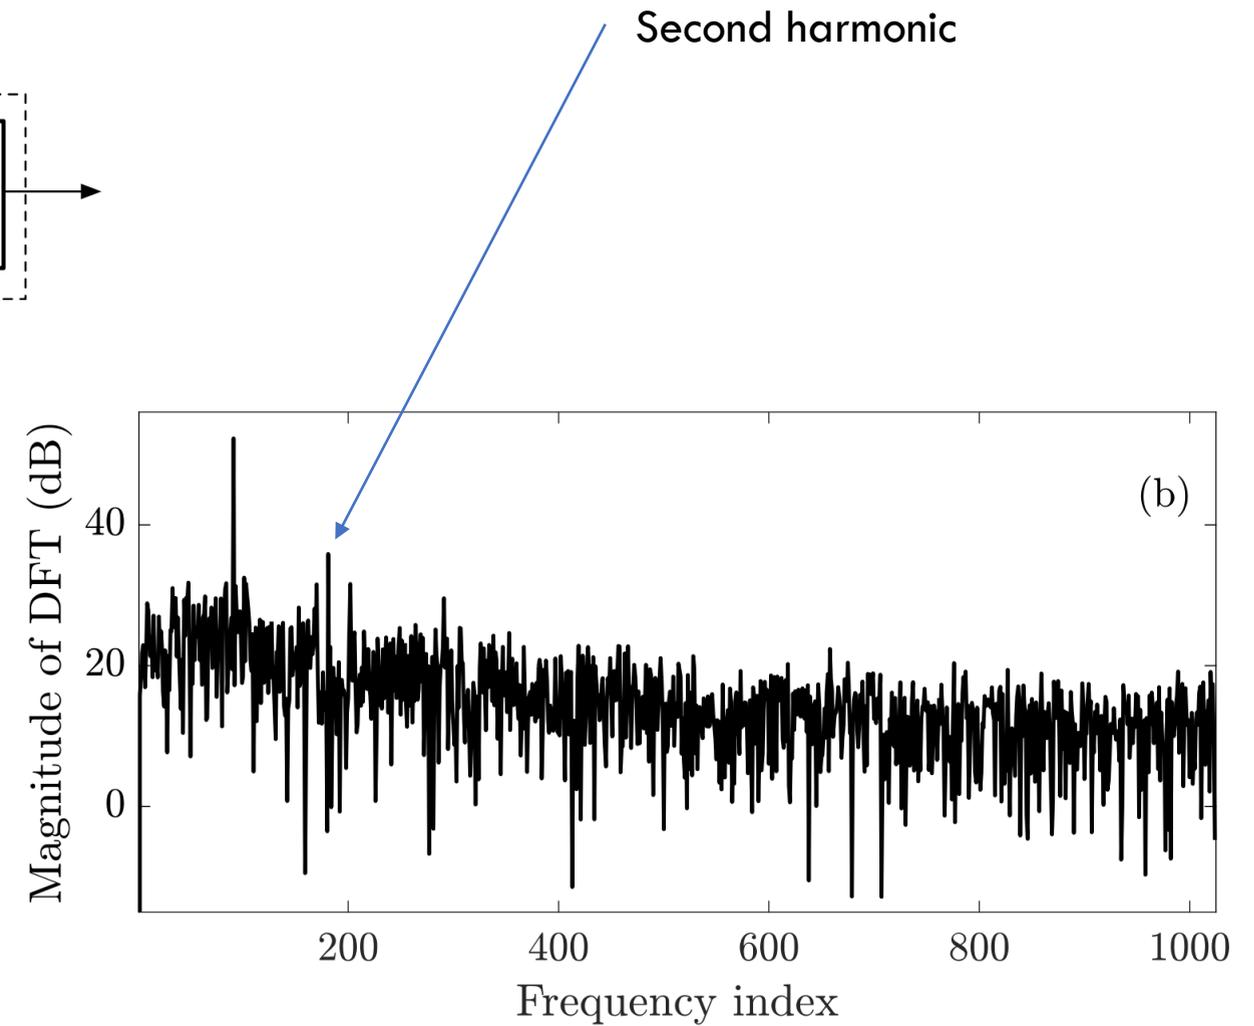

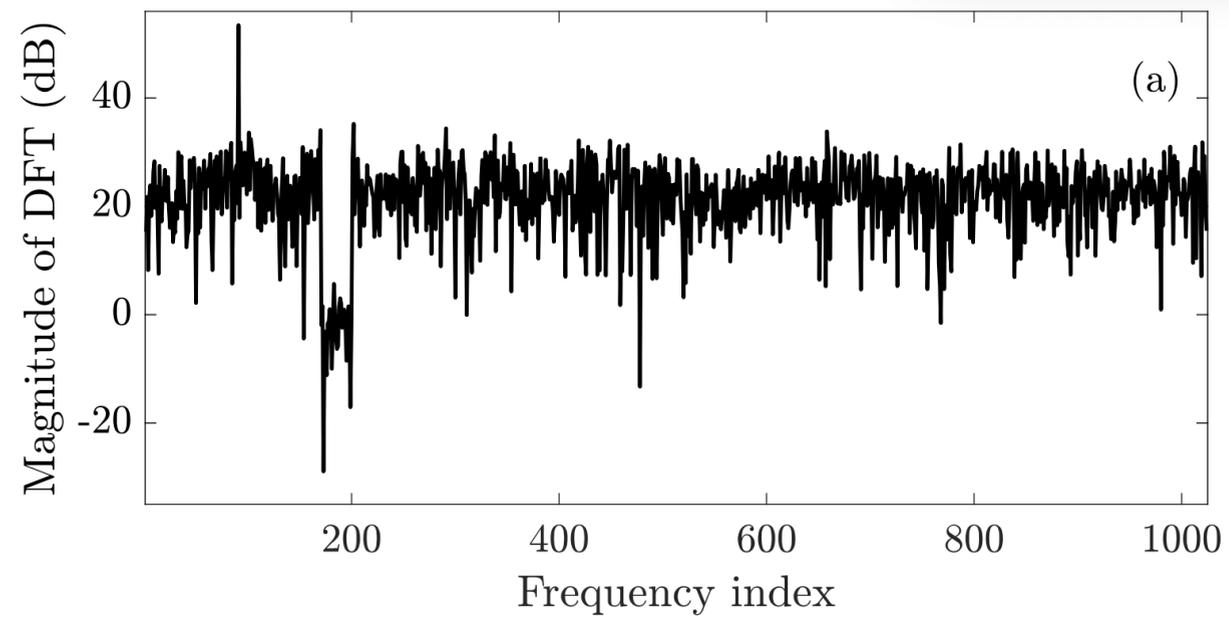

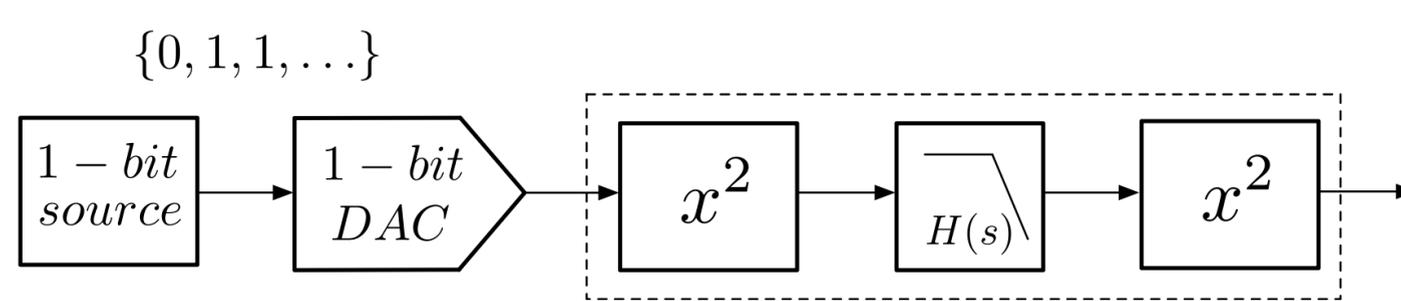

EXPERIMENTAL RESULTS

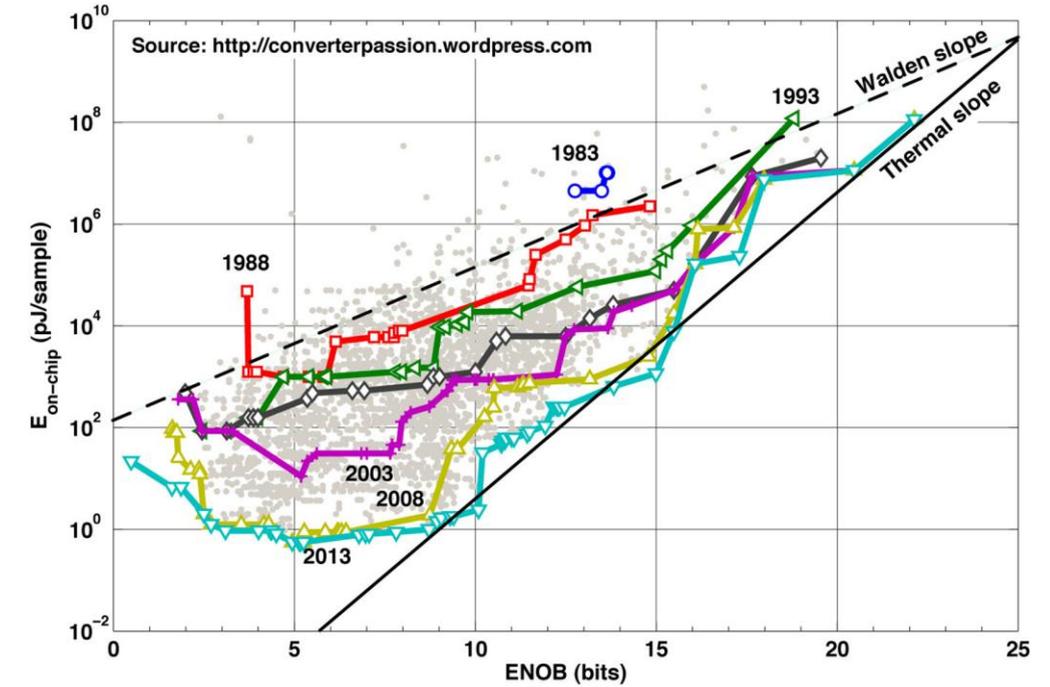

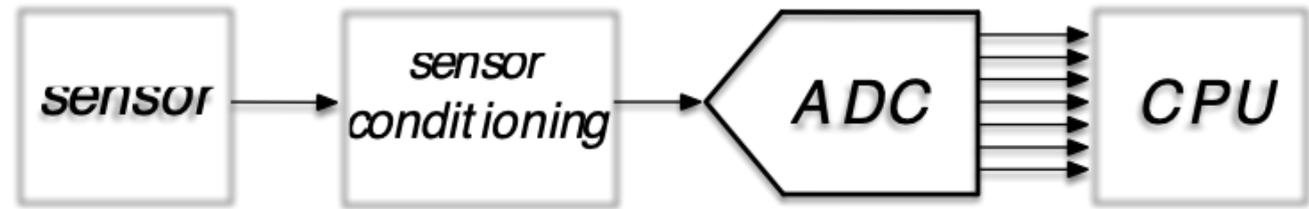

Quality of reconstructed analog signal depends on the used reconstruction filter

Values of SINAD of 52.6 dB when using $N=8192$ samples and an elliptic low-pass filter

EXAMPLE: SIMPLE IDENTIFICATION OF HAMMERSTEIN-WIENER MODEL

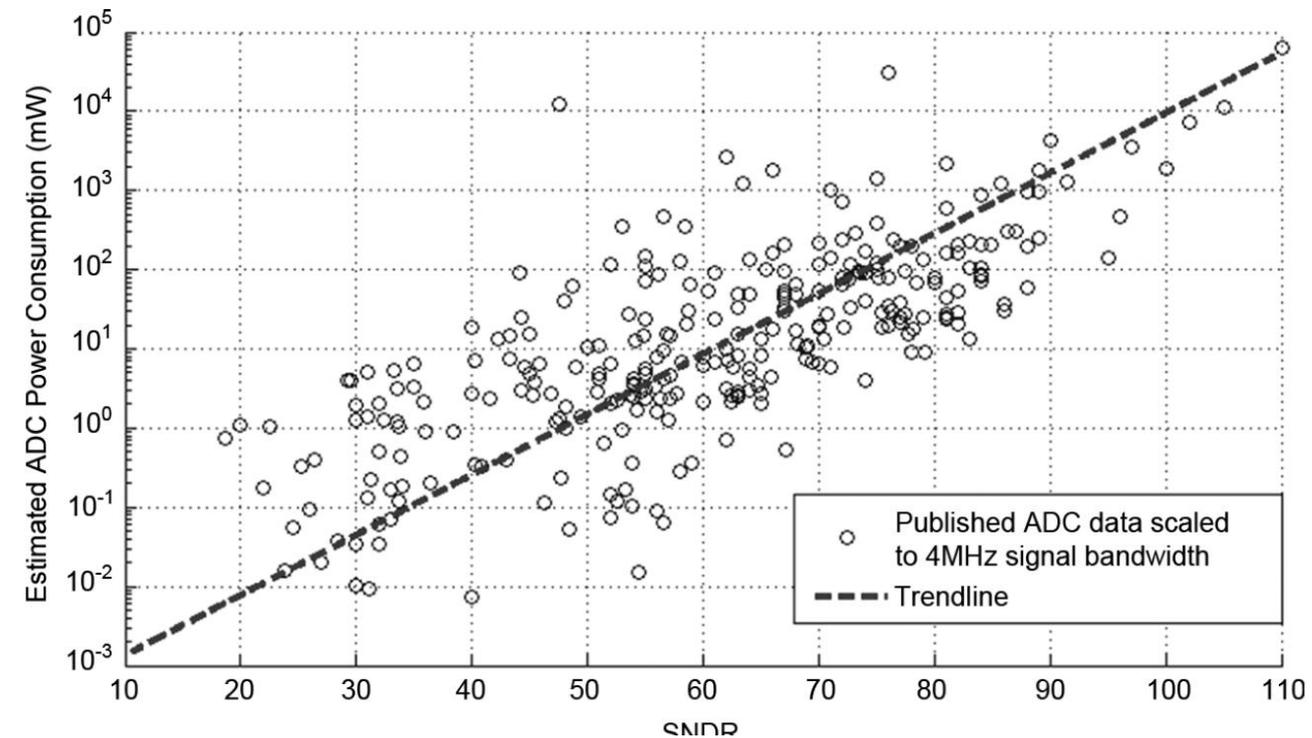

VISION OF LOW-POWER, LOW-COMPLEXITY MEASUREMENTS

From analog to digital:

Push for faster, higher resolution ADCs

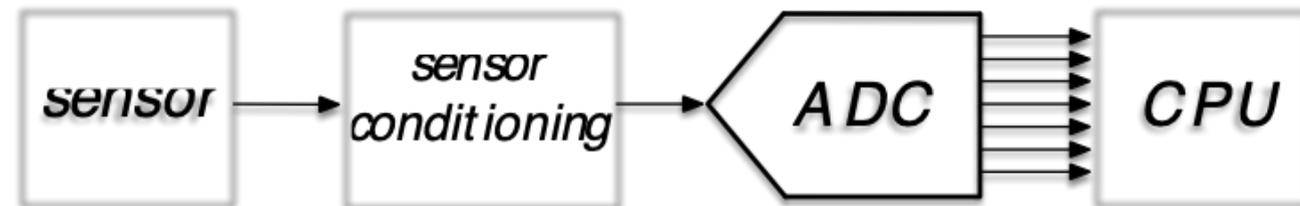

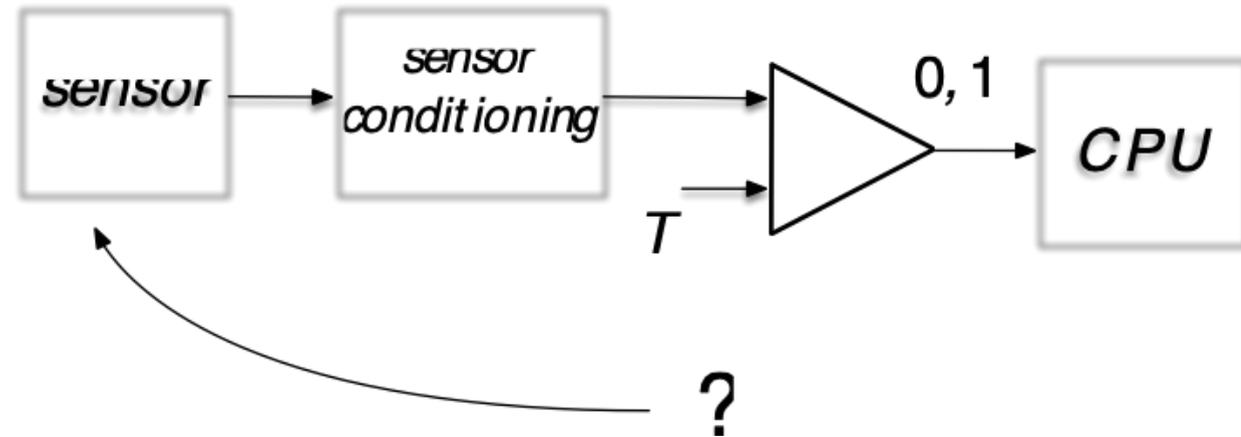

Power consumption in ADCs increases exponentially with number of resolution bits

ONE-BIT SENSING AND MEASUREMENT

- **One-bit** is the simplest possible digital measurement approach
- When low-power is a constraint
- When system complexity can be a problem, e.g. in *analog built-in self test* systems
- When having **massive** number of channels, e.g. **hundreds of channels** in photoacoustic, laser-induced ultrasound, and X-ray acoustic real-time imaging applications
- When sampling at **large sampling rates** (e.g., >1 GSa/s) to reduce **cost/complexity/power**
- When reliability must be increased
- Overall, it offers new opportunities to expand measurement processes
- **New developments:** one-bit LLMs

THE MAIN ACQUISITION PROBLEM

- Can we still say something meaningful about the signal produced by the sensor?
- How much information can we extract from the binary data?
- How do we use prior information available about the signal?

SYSTEM AND SIGNAL SETTINGS

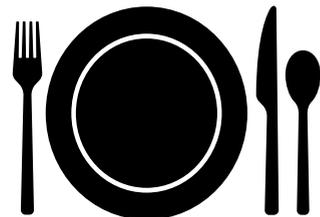

Assistive signals: not present, stochastic vs deterministic, no information, mean and variance known, distribution known, samples known.

Signal to be measured: periodic, quasi-periodic, sampled synchronously, asynchronously

Noise: with known/unknown PDF

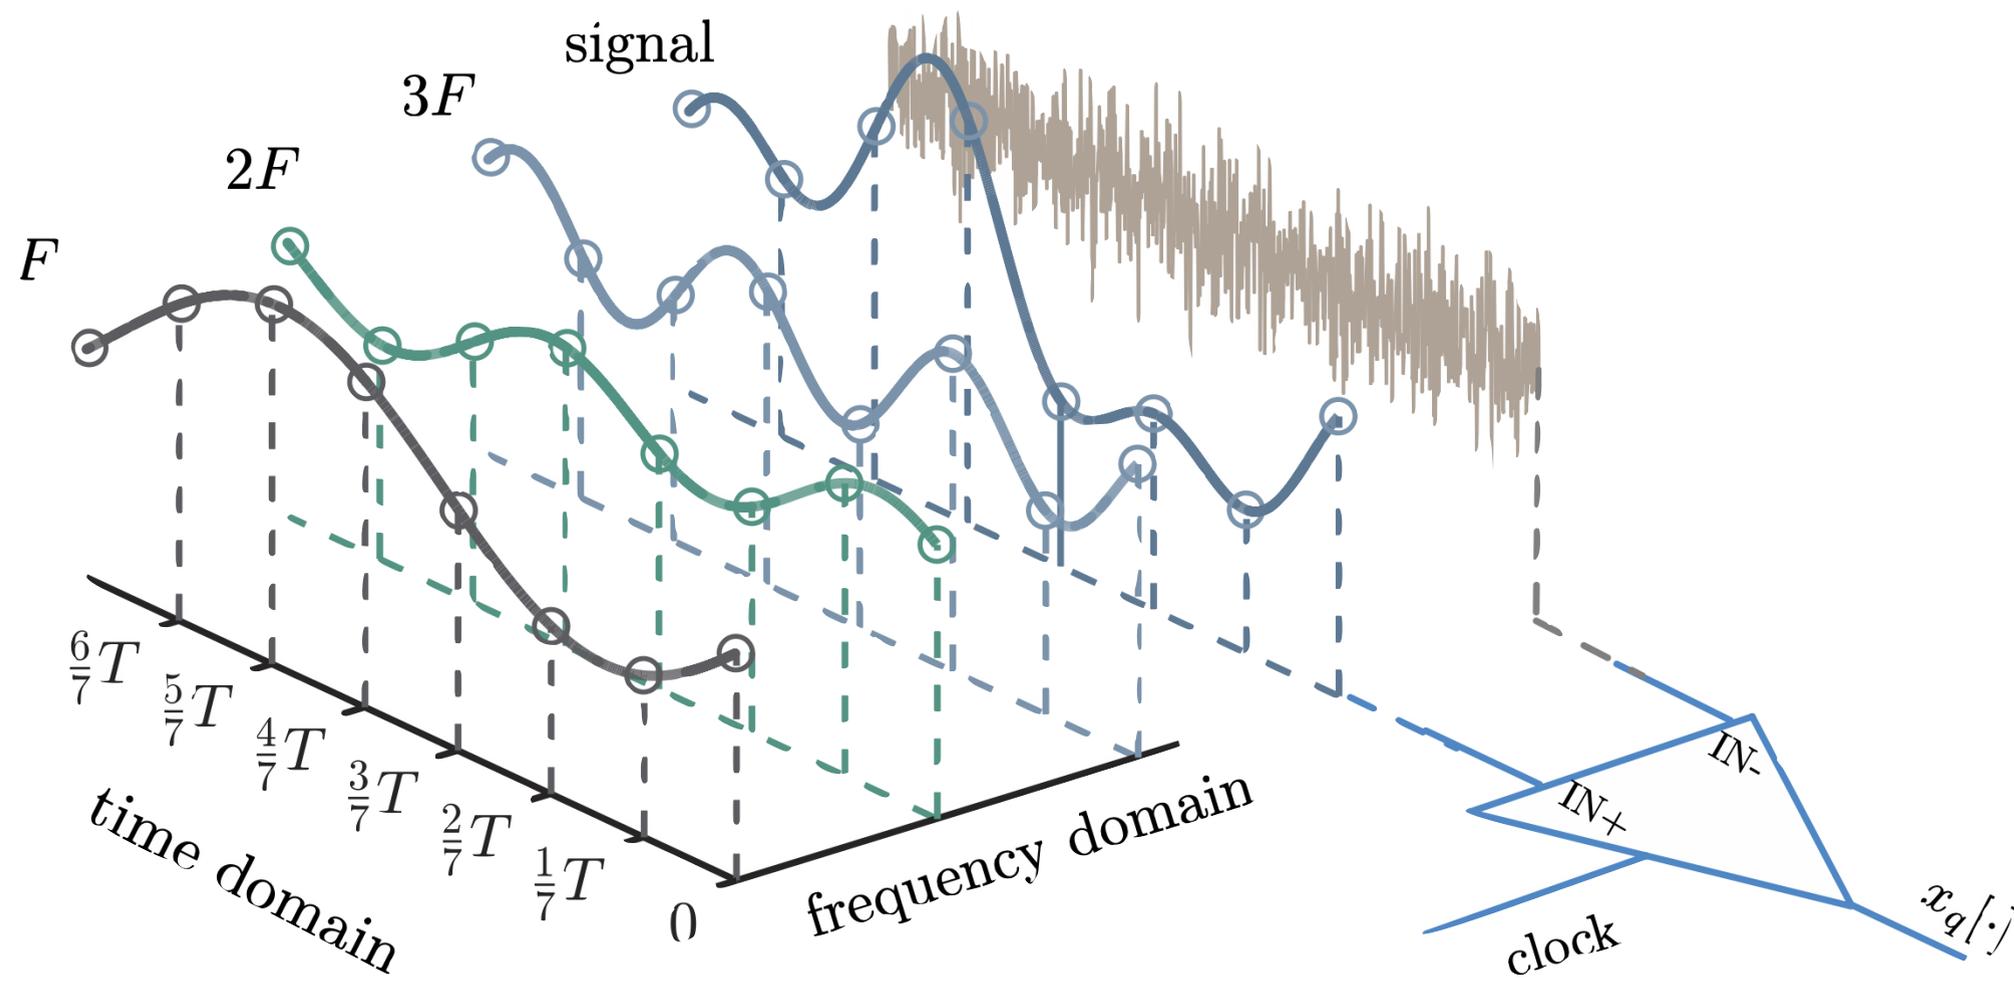

Various approaches available: a one-bit framework can be setup

one method is described: stochastic dither, PDF known

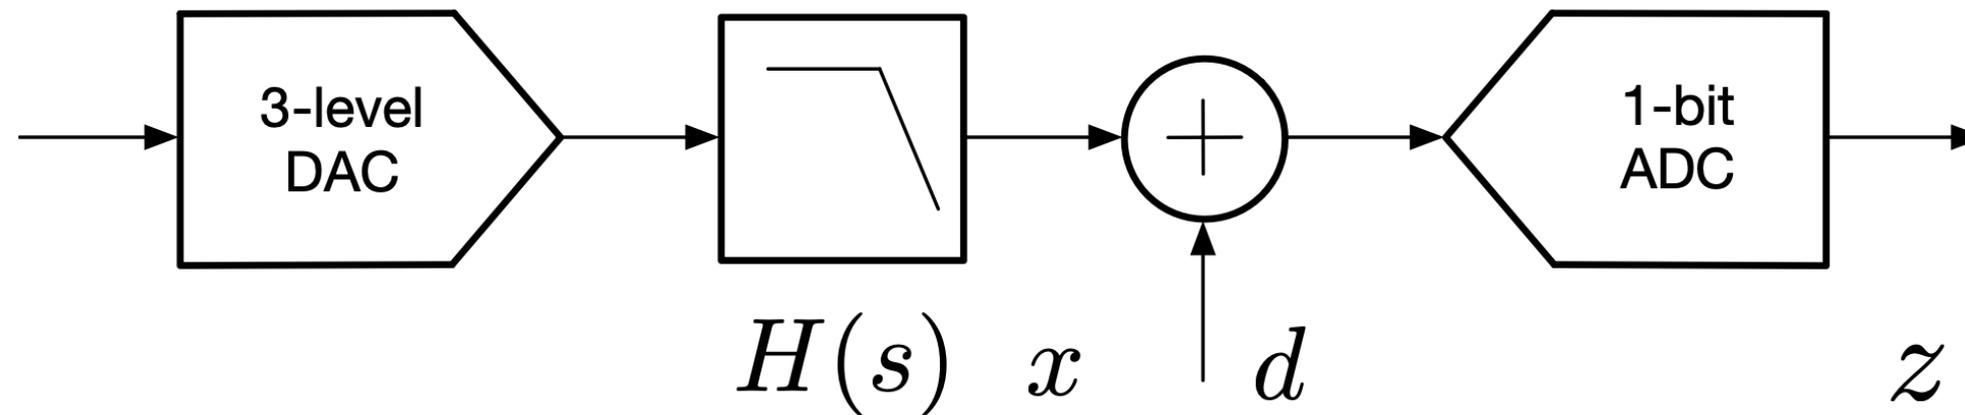

THE SETTING

- **Periodic** signal (sampled synchronously) and **random dither** (assistive signal)
- Signal frequency known
- Know the *dither* probability density function (PDF)
- **Estimate amplitudes and phases** using one-bit sequence

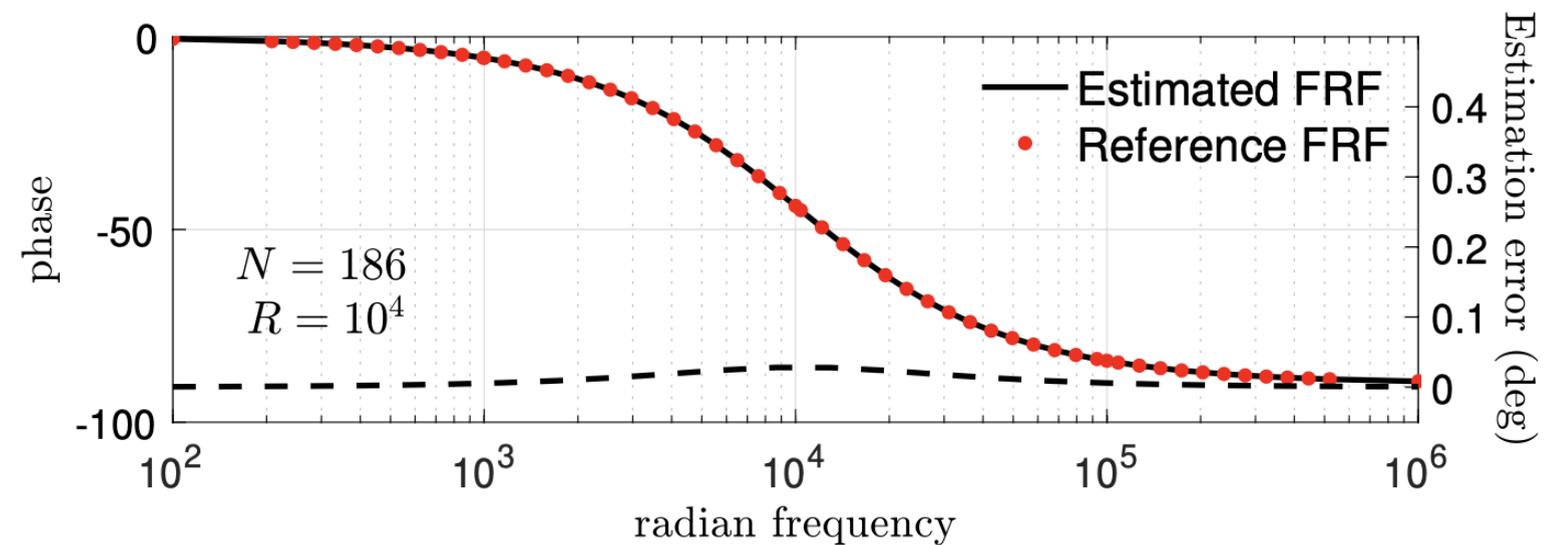

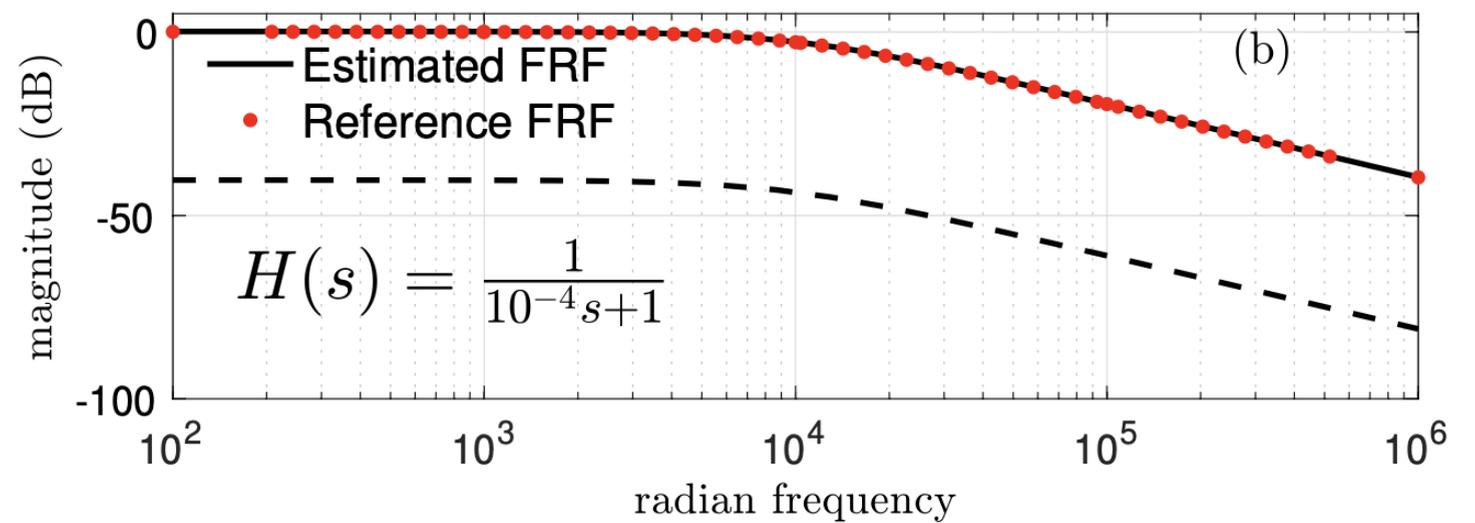

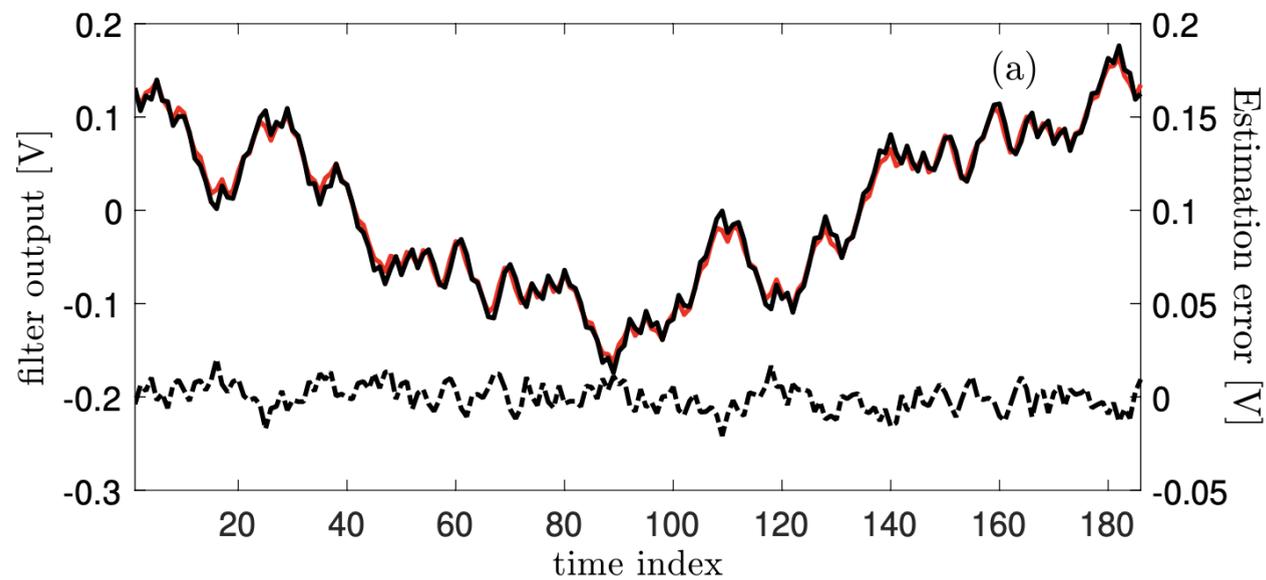

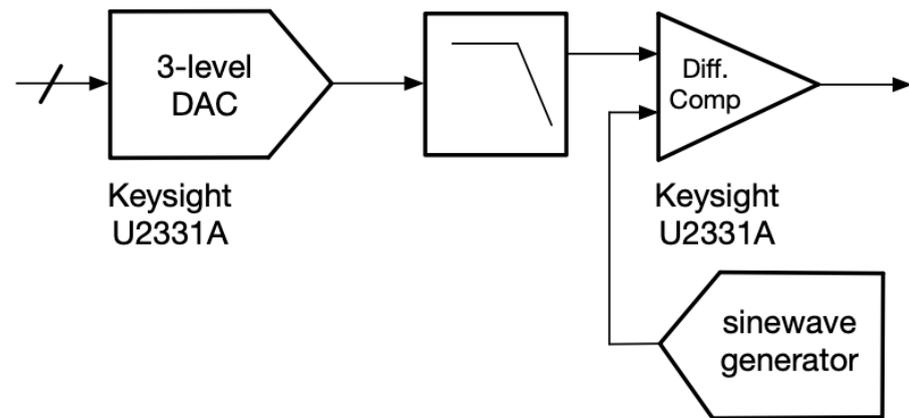

EXAMPLE: 1.5 BIT FOURIER ANALYZER

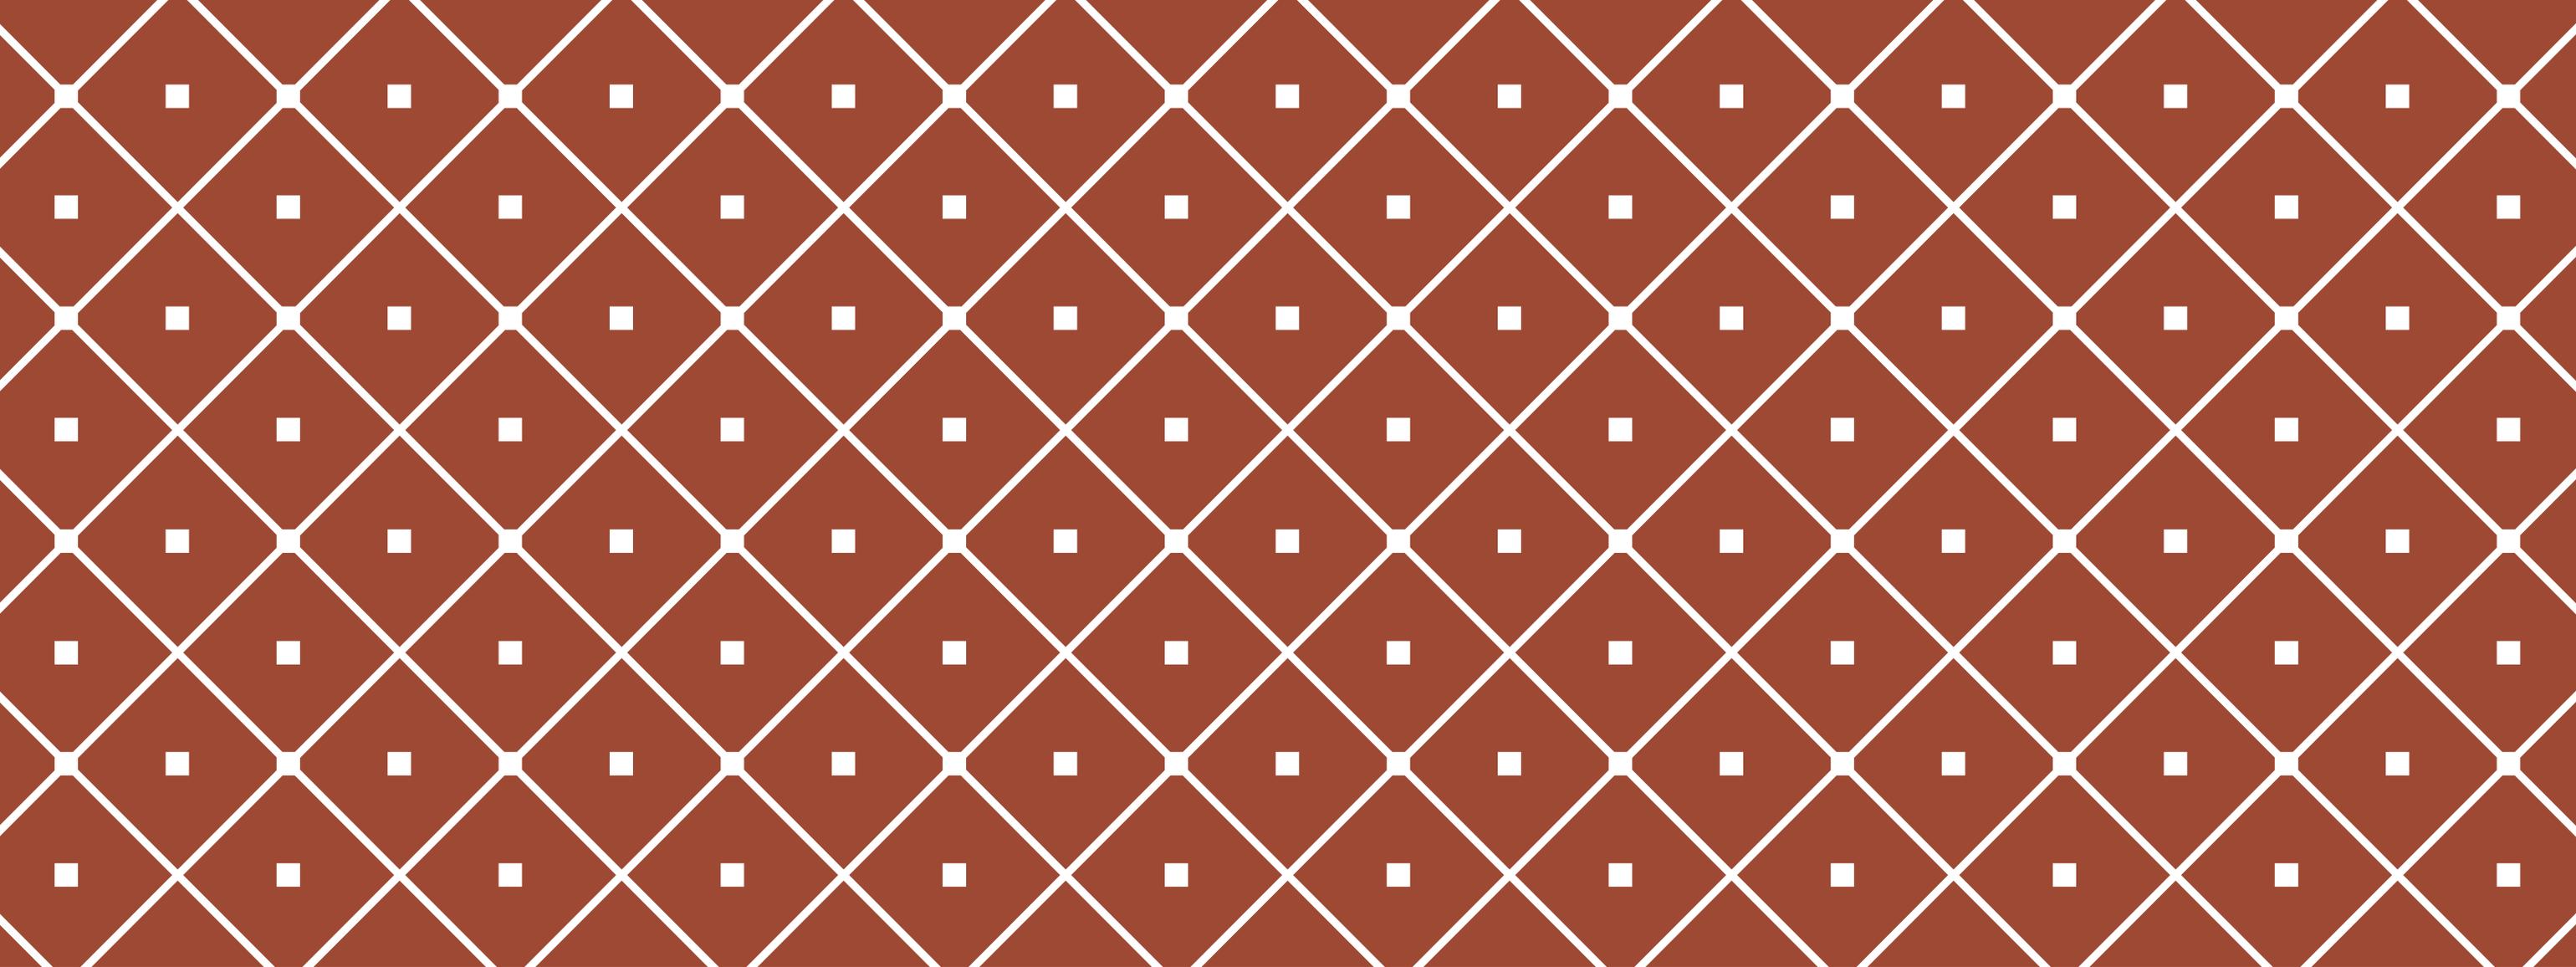

Measure the FRF of a linear system

3-level DAC to allow detection of **nonlinear** behavior; binary DAC would suffice otherwise
Sinewave dither (treated as **random** dither) with known PDF (bath-tube)

MEASURING THE FRF: EXPERIMENTS

WORKING EXAMPLES

MATERIAL SENSING USING ONE-BIT

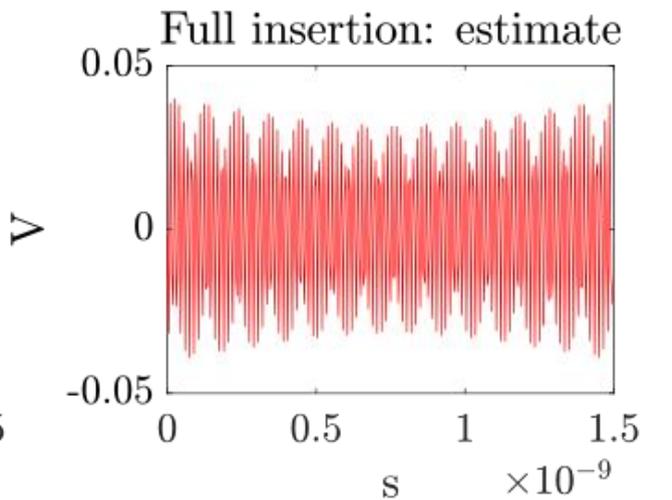

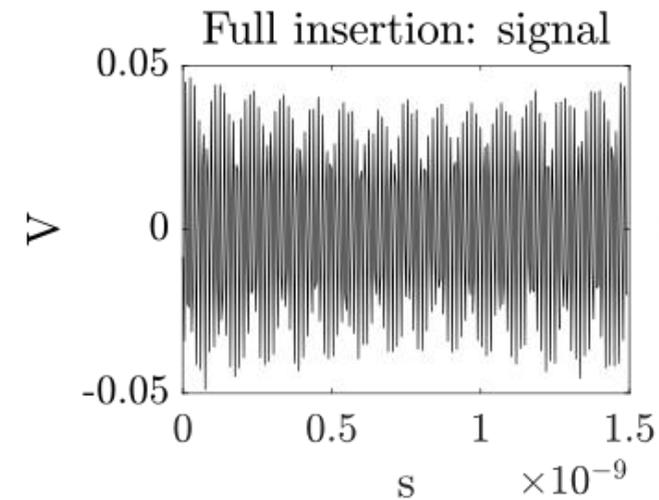

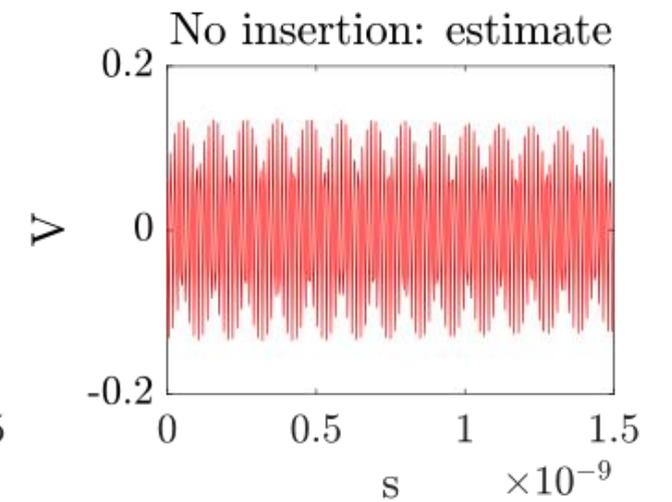

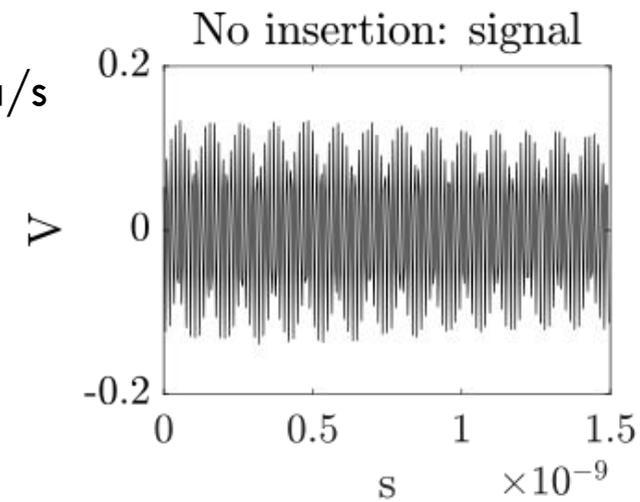

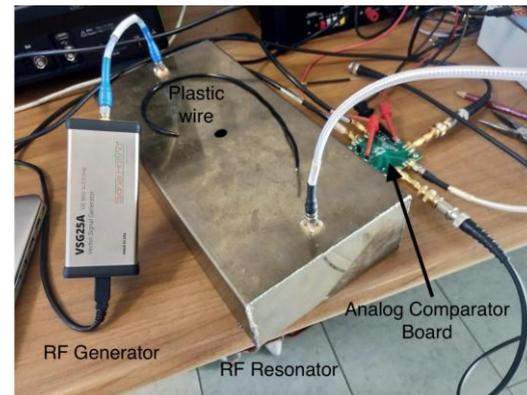

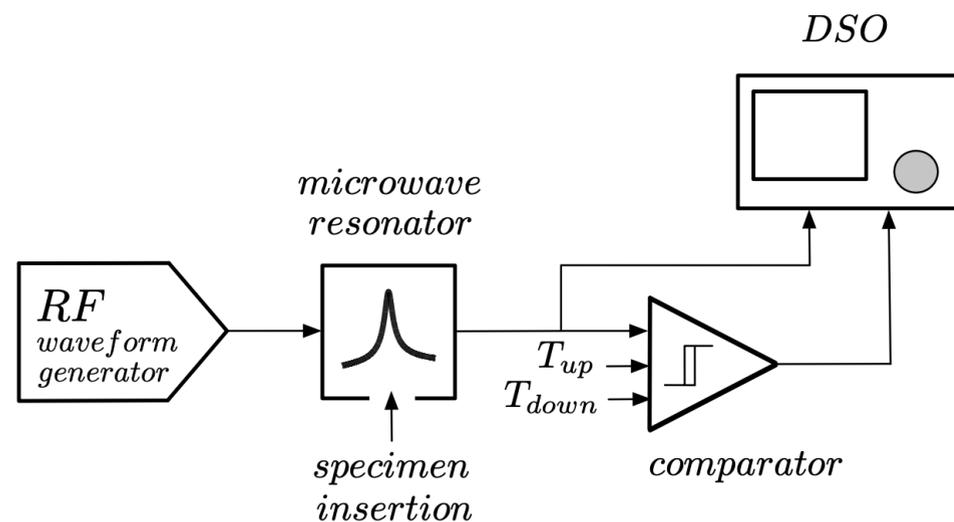

Conventional approach uses energy detector / RF direct digital receivers

Time-domain analysis based on commercial one-bit comparator @ 1.745 GSa/s

FRF response function shifts as a function of the MUT

Texas instruments comparator TLV 3801, laboratory microwave resonator, Teledyne Lecroy DSO

Two component excitation signal – no assistive signals

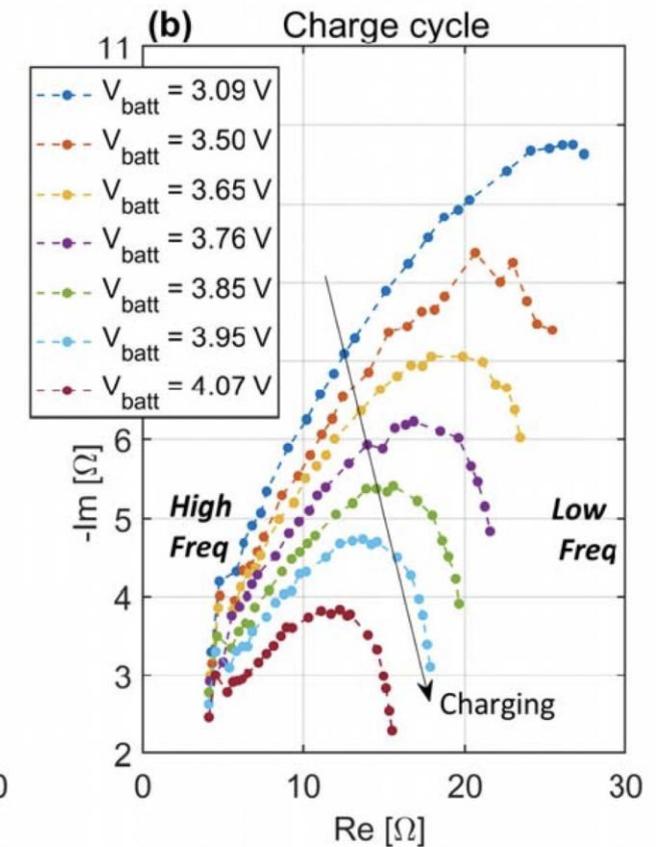

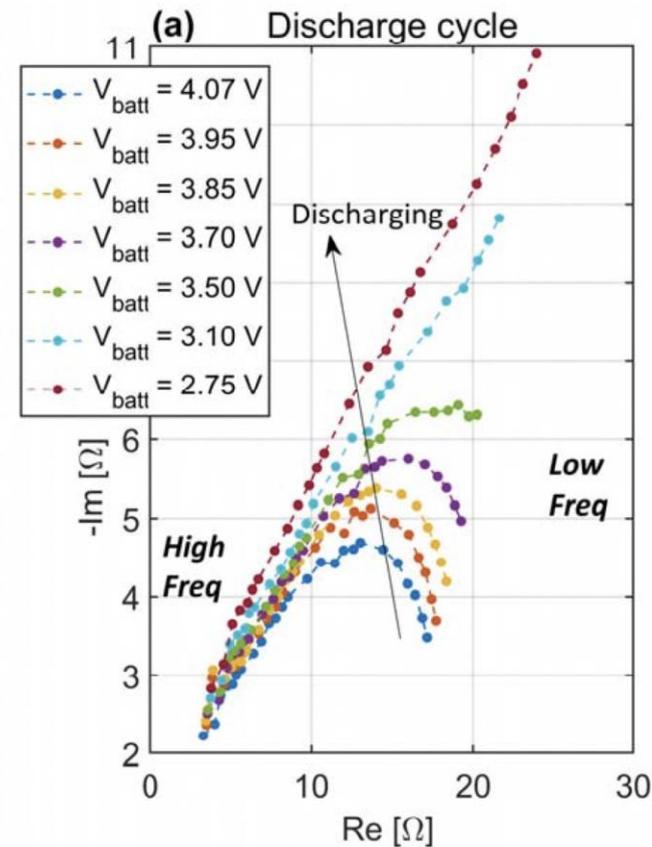

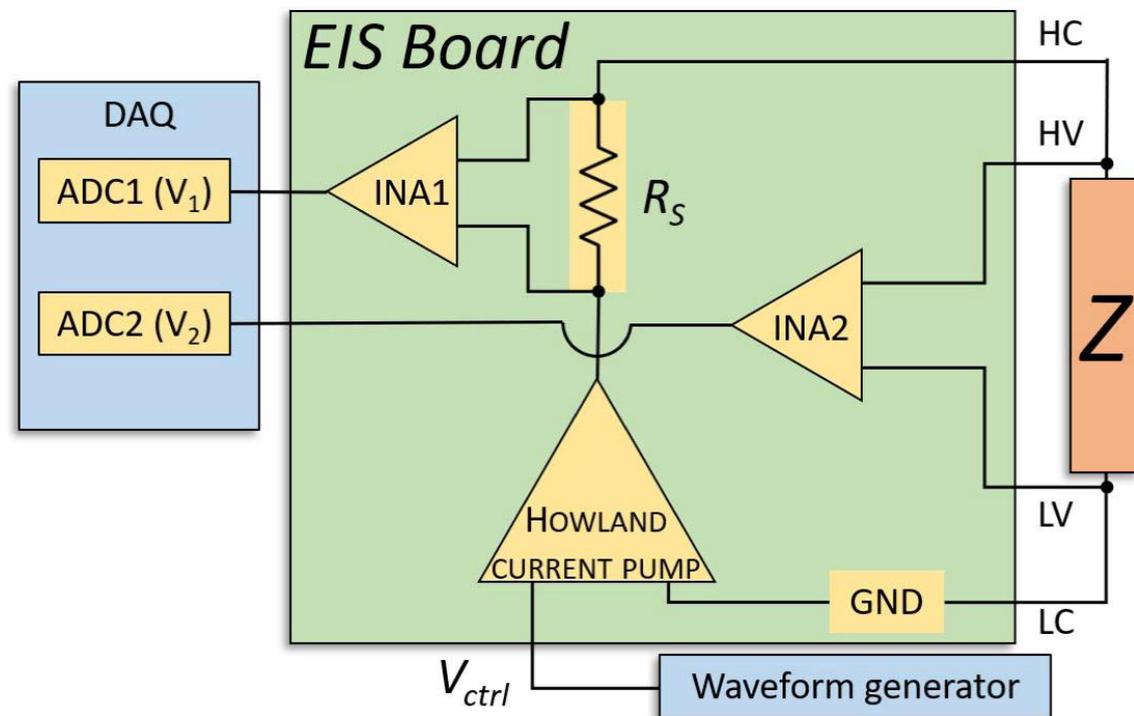

MEASURING THE IMPEDANCE OF A RECHARGEABLE BATTERY

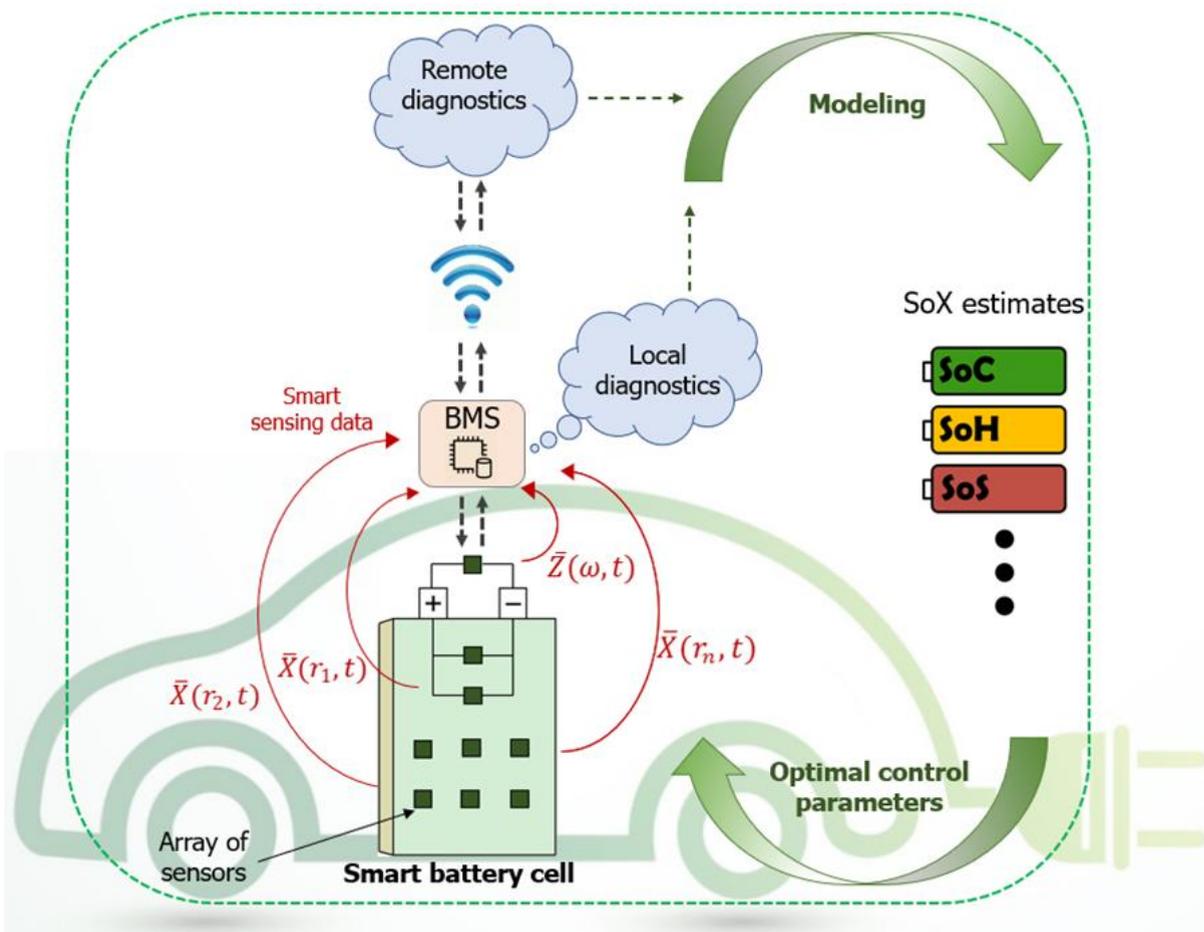

Electrochemical impedance spectroscopy (EIS) for assessing SOC, SOH of rechargeable batteries

Measure battery impedance

Simplest setup: current excitation and voltage measurements at the battery contacts

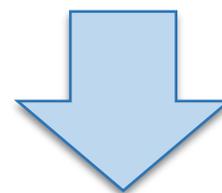

ONLINE EIS OF BATTERY CELLS

IN-SITU monitoring

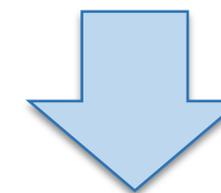

- Compact system or integrated into the battery cell
- Low-cost system for mounting on every single cell

VLSI technology enables simple integration within the battery

IN-OPERANDO monitoring

- Fast measurement time while the battery is working
- Accurate estimate of small battery impedance values

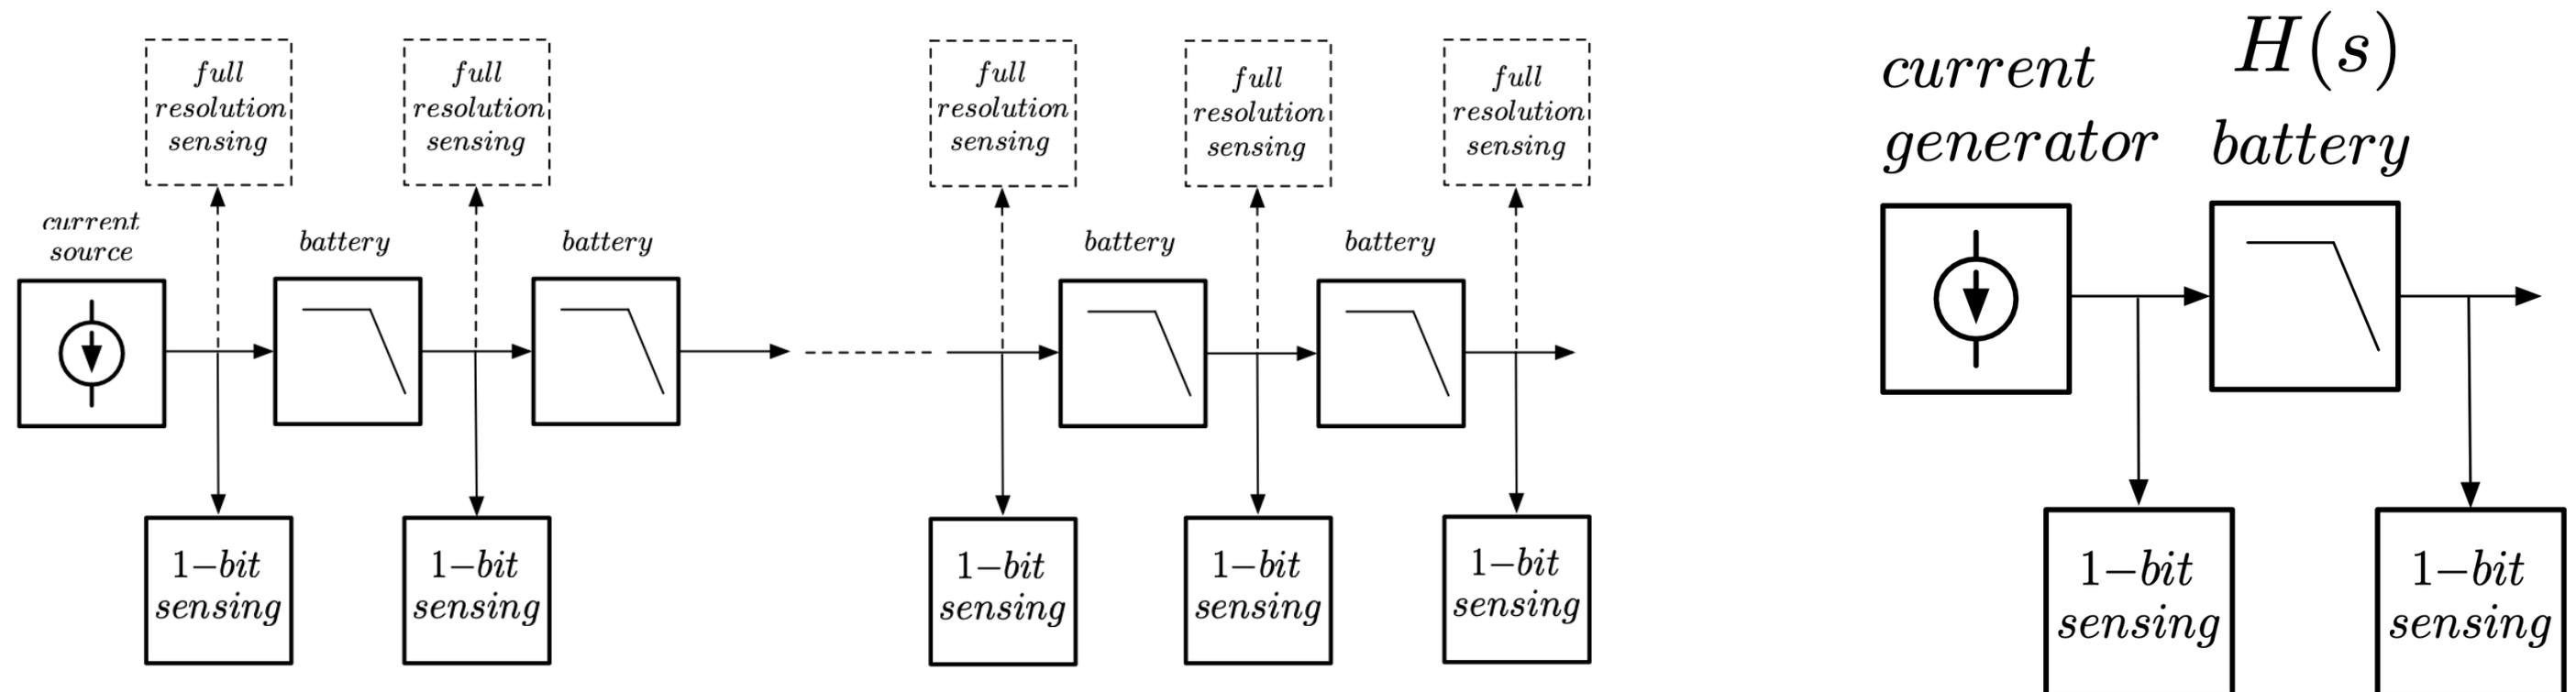

Efficient estimation algorithms

MODULE/PACK-LEVEL ONE-BIT ARCHITECTURE

Systems may include thousands of rechargeable battery cells

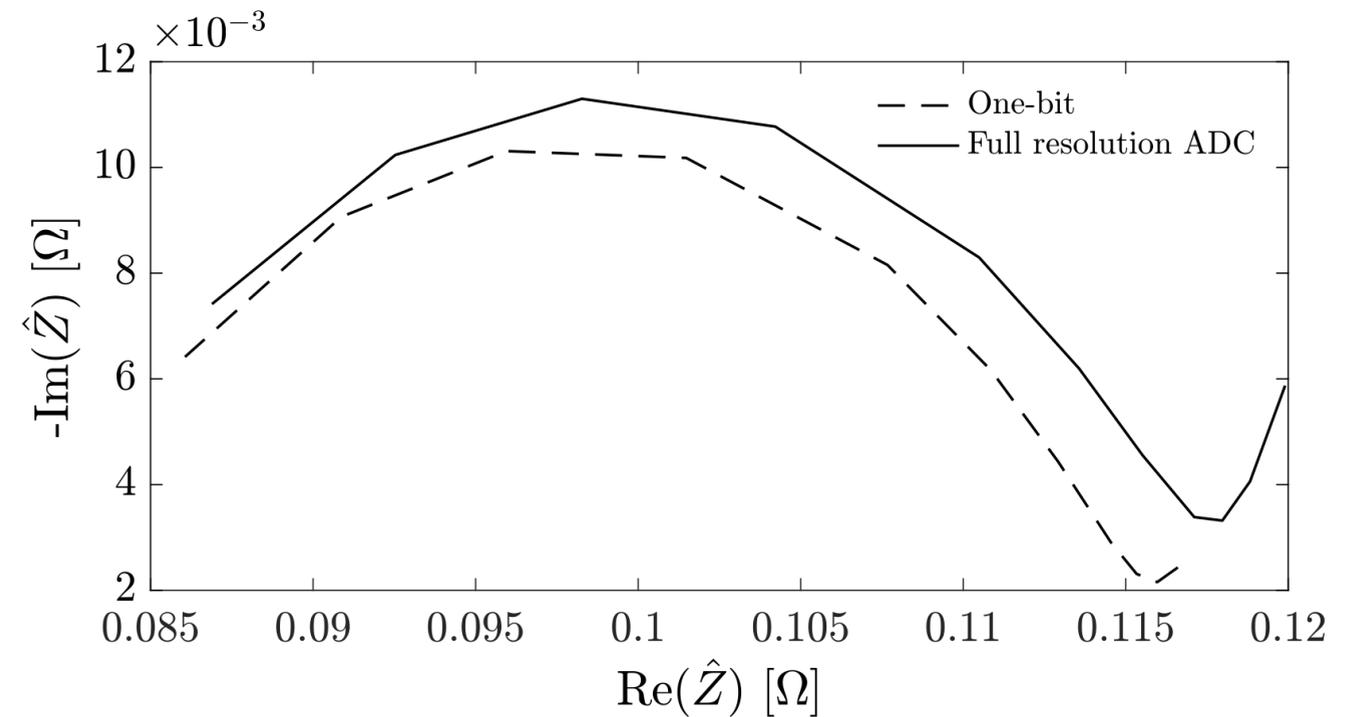

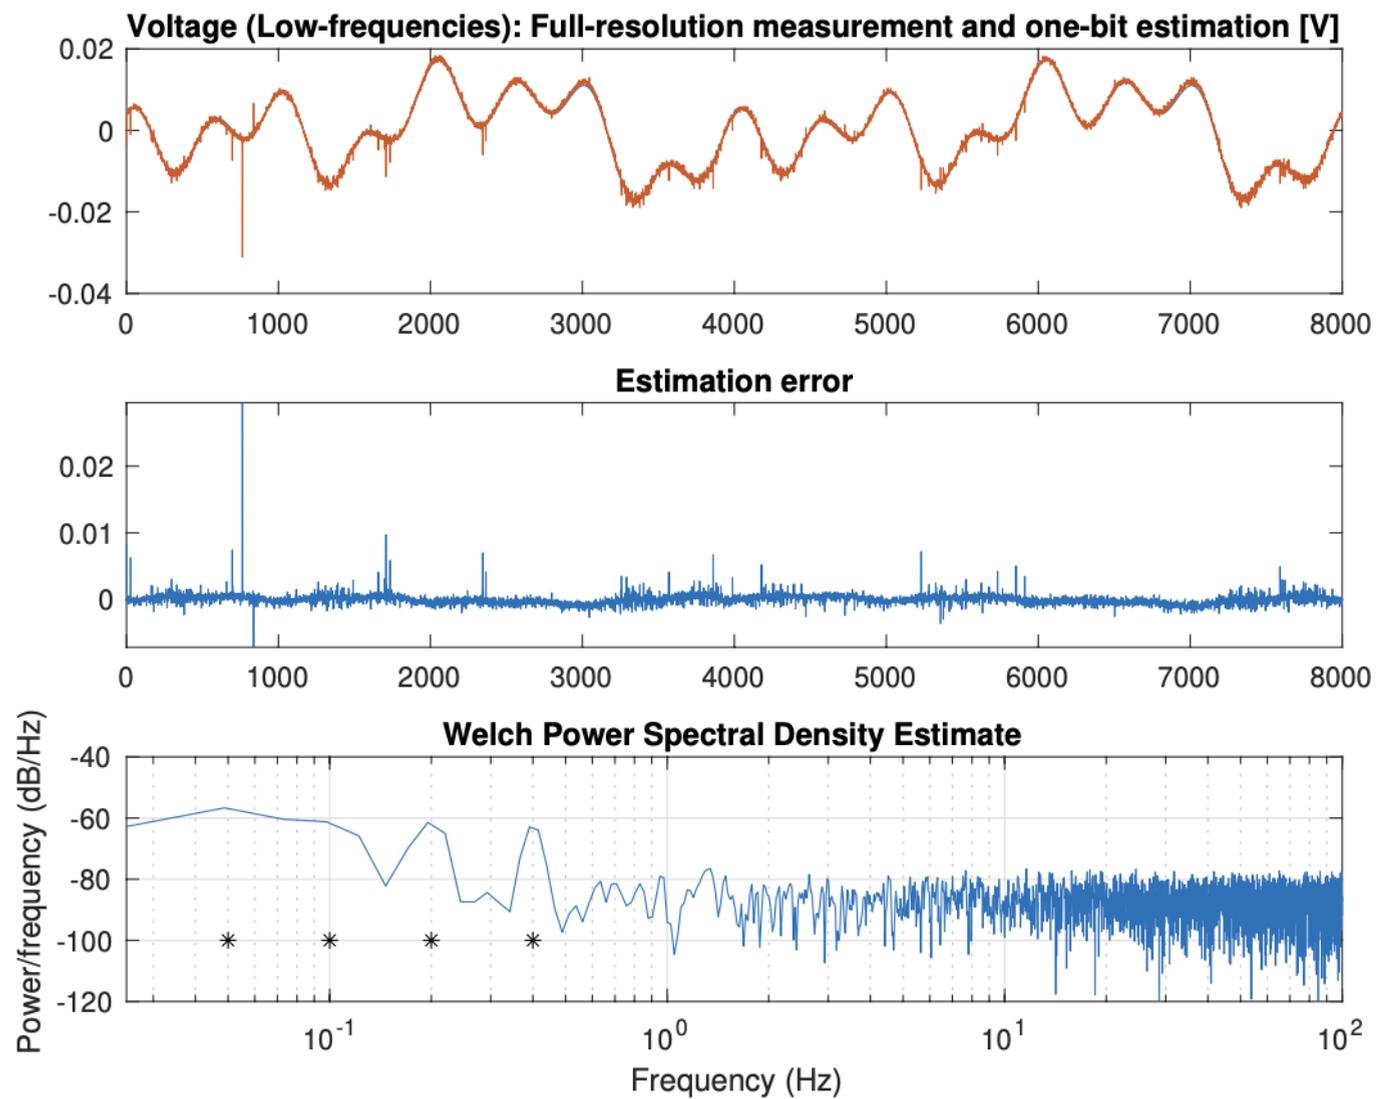

Would it be possible to realize a one-bit simplified architecture to perform EIS at battery cell level?

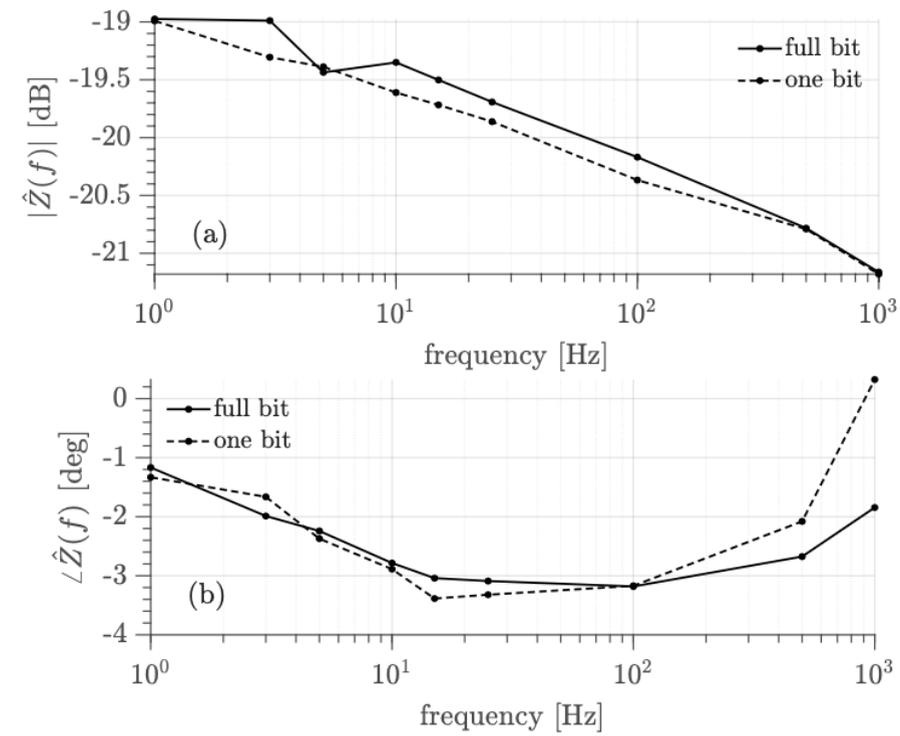

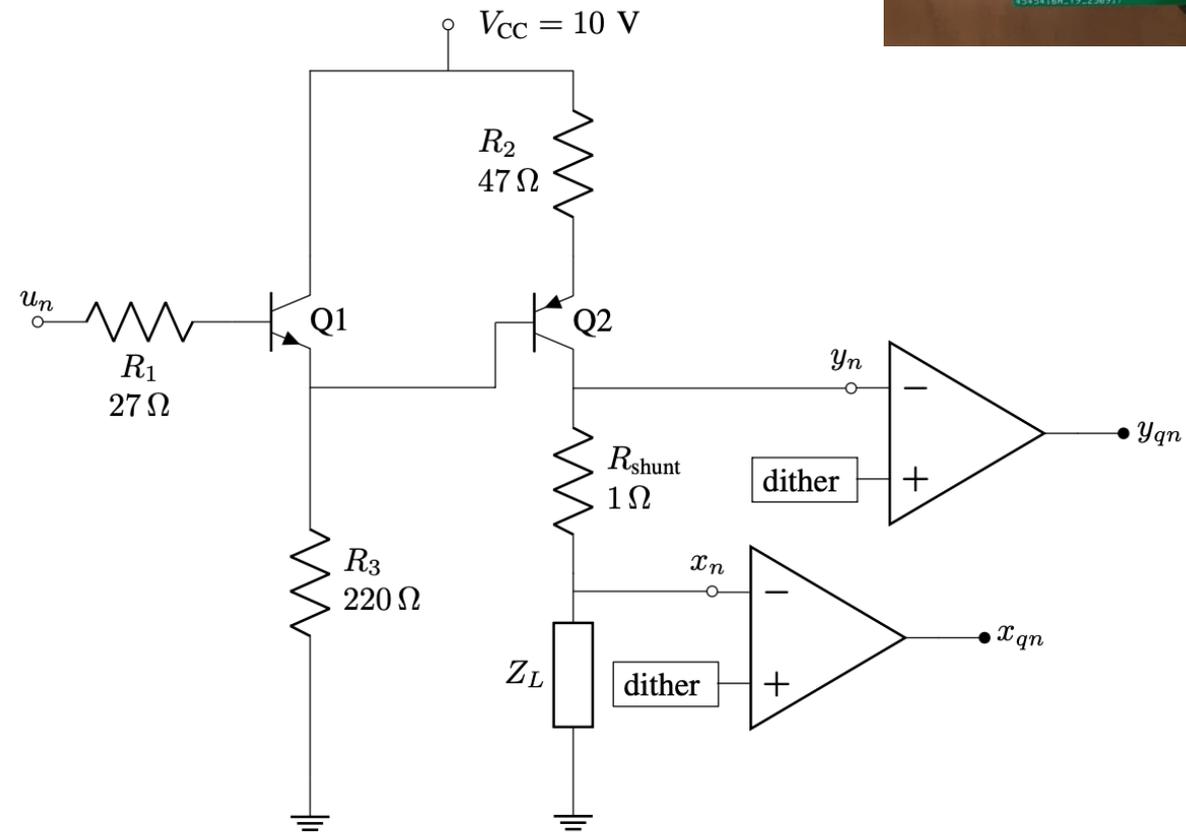

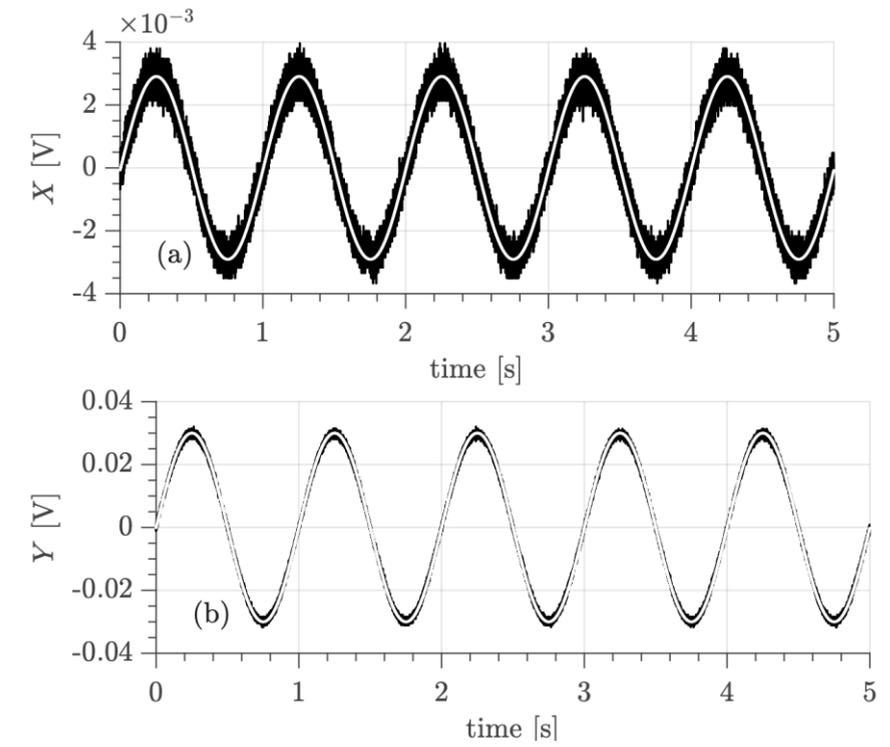

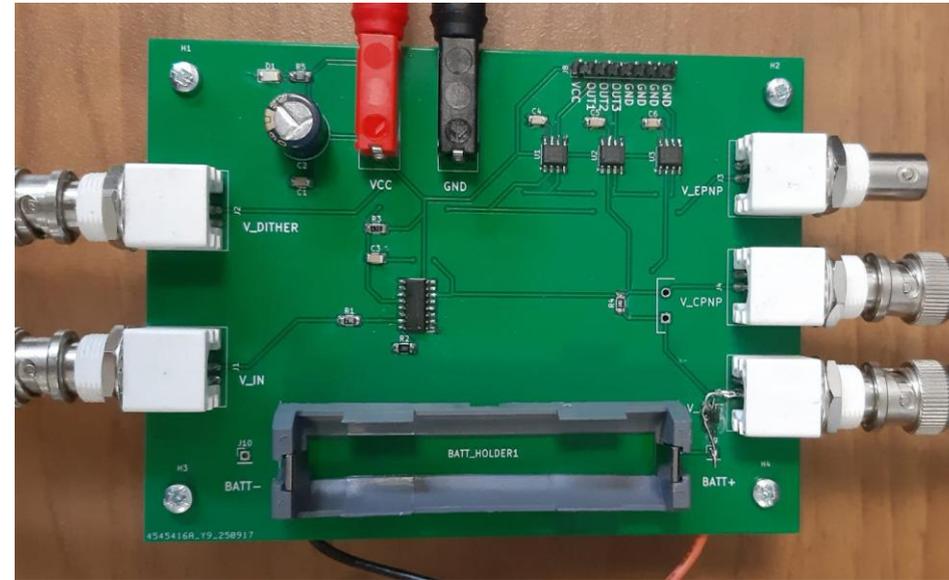

ONE-BIT EIS: MEASUREMENT RESULTS

Voltage and current measurements

16 bit full-resolution measurements shown for comparison

REALIZATION

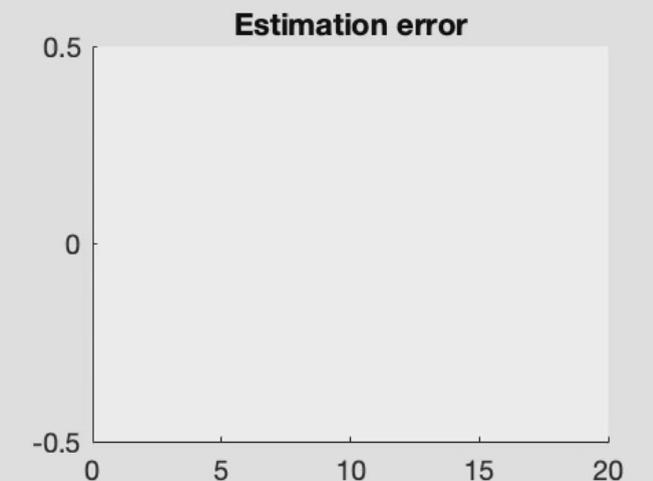

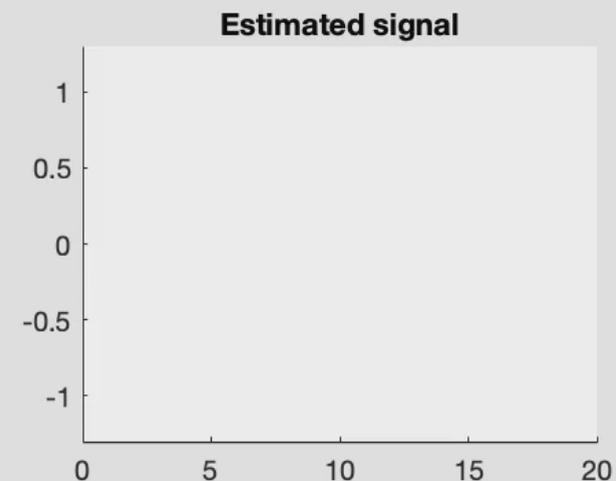

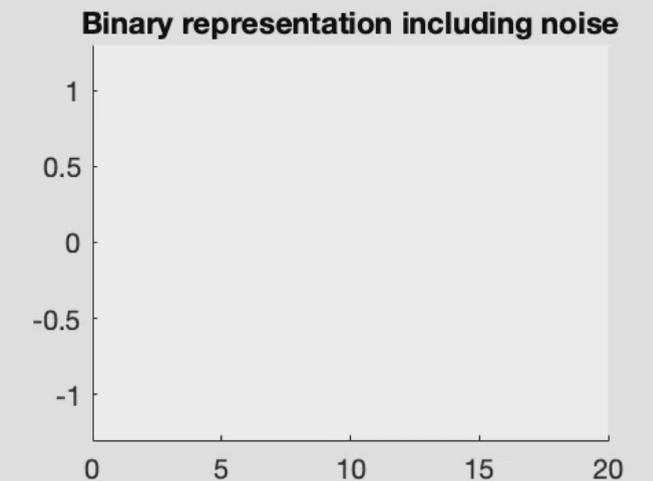

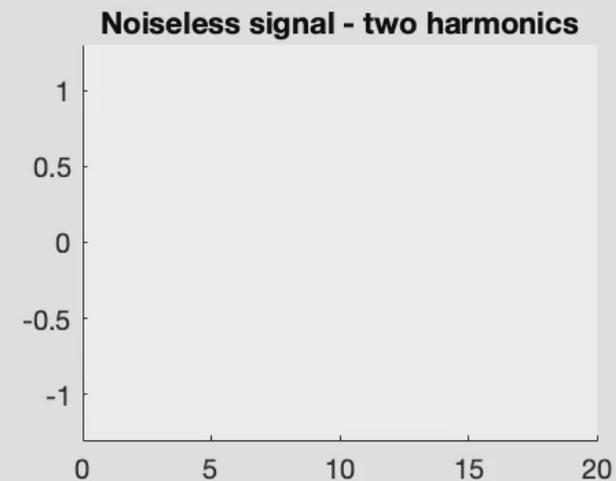

SEQUENTIAL ALGORITHM

two-component signal, **no assistive signals**,
Gaussian noise, threshold at 0.25 V

sudden change in signal amplitude after 10 s

Estimation based on processing the most recent 400
samples (*windowed approach*)

Estimation starts after the first 400 samples

CONCLUSION

- **Sustainable electronics requires new ways of thinking**

Low-complexity, low-power measurement approaches are essential for reliable, energy-efficient systems

- **Metrology is a driver of sustainability**

From IC manufacturing to e-waste recycling, meaningful measurements reduce waste, improve yield, and support responsible lifecycle design

- **Education shapes future impact**

Embedding sustainability, lifecycle awareness, and eco-design into STEM curricula empowers the next generation to engineer responsibly

- **Innovation enables climate-aware behavior**

Clear communication, transparent reporting, and user-centric tools help individuals and industries make better environmental decisions

- **The path forward**

Combine advanced measurement science, sustainable engineering, and global collaboration to create electronics that serve both humanity and the planet

IN THE END, REMEMBER ...

Obrigado!

Periodic signal recovery using binary samples is possible with random/deterministic assistive signals, e.g. FRF measurement

Validation might be possible by estimating the error PDF after the estimation

Calibration might be necessary

Works as well when periodic signal sampling is asynchronous

More complex algorithms when the signal frequency is unknown

Few conditions must be respected for consistent signal estimation (e.g. what if all zeros or ones?)

Other techniques available that do not require assistive signals

Obrigado
